

Lehninger

SIXTH EDITION

# Principles of Biochemistry

David L. Nelson | Michael M. Cox

# Media Connections

---

Below is a chapter-by-chapter list of the media resources available on the Instructor's CD-ROM and website [www.courses.bfwpub.com/lehninger6e](http://www.courses.bfwpub.com/lehninger6e).

- Mechanism Animations (12 total) show key reactions in detail.
- Technique Animations (10 total) reveal the experimental techniques available to researchers today.
- Living Graphs (15 total) allow students to alter the parameters in key equations and graph the results.
- Molecular Structure Tutorials (9 total) guide students through concepts using three-dimensional molecular models.

New animations will be added throughout the life of the edition.

## Chapter 2 Water

Living Graph: Henderson-Hasselbalch Equation

## Chapter 3 Amino Acids, Peptides, and Proteins

Molecular Structure Tutorials: Protein Architecture—Amino Acids

Technique Animation: SDS Gel Electrophoresis

## Chapter 4 The Three-Dimensional Structure of Proteins

Molecular Structure Tutorials:

Protein Architecture—Sequence and Primary Structure

Protein Architecture—The  $\alpha$  Helix

Protein Architecture—The  $\beta$  Sheet

Protein Architecture—Turn

Protein Architecture—Introduction to Tertiary Structure

Protein Architecture—Tertiary Structure of Fibrous Proteins

Protein Architecture—Tertiary Structure of Small Globular Proteins

Protein Architecture—Tertiary Structure of Large Globular Proteins

Protein Architecture—Quaternary Structure

## Chapter 5 Protein Function

Molecular Structure Tutorial: Oxygen-Binding Proteins—Myoglobin: Oxygen Storage

Living Graphs:

Protein-Ligand Interactions

Binding Curve for Myoglobin

Molecular Structure Tutorial: Oxygen-Binding Proteins—Hemoglobin: Oxygen Transport

Living Graphs:

Cooperative Ligand Binding

Hill Equation

Molecular Structure Tutorials:

Oxygen-Binding Proteins—Hemoglobin Is Susceptible to Allosteric Regulation

Oxygen-Binding Proteins—Defects in Hb Lead to Serious Genetic Disease

MHC Molecules

Technique Animation: Immunoblotting

## Chapter 6 Enzymes

Living Graphs:

Michaelis-Menten Equation

Competitive Inhibitor

Uncompetitive Inhibitor

Mixed Inhibitor

Mechanism Animation: Chymotrypsin Mechanism

Living Graph: Lineweaver-Burk Equation

## Chapter 8 Nucleotides and Nucleic Acids

Molecular Structure Tutorial: Nucleotides, Building Blocks of Amino Acids

Technique Animation: Dideoxy Sequencing of DNA

## Chapter 9 DNA-Based Information Technologies

Molecular Structure Tutorial: Restriction Endonucleases

Technique Animations:

Plasmid Cloning

Reporter Constructs

Polymerase Chain Reaction

Synthesizing an Oligonucleotide Array  
Screening an Oligonucleotide Array for Patterns  
of Gene Expression  
Yeast Two-Hybrid Systems  
Creating a Transgenic Mouse

### **Chapter 11 Biological Membranes and Transport**

Living Graphs:  
Free-Energy Change for Transport  
Free-Energy Change for Transport of an Ion

### **Chapter 12 Biosignaling**

Molecular Structure Tutorial: Trimeric G Proteins—  
Molecular On/Off Switches

### **Chapter 13 Bioenergetics and Biochemical Reaction Types**

Living Graphs:  
Free-Energy Change  
Free-Energy of Hydrolysis of ATP

### **Chapter 14 Glycolysis, Gluconeogenesis, and the Pentose Phosphate Pathway**

Mechanism Animations:  
Phosphohexose Isomerase Mechanism  
Alcohol Dehydrogenase Mechanism  
Thiamine Pyrophosphate Mechanism

### **Chapter 16 The Citric Acid Cycle**

Mechanism Animation: Citrate Synthase  
Mechanism

### **Chapter 17 Fatty Acid Catabolism**

Mechanism Animation: Fatty Acyl-CoA  
Synthetase Mechanism

### **Chapter 18 Amino Acid Oxidation and the Production of Urea**

Mechanism Animations:  
Pyridoxal Phosphate Reaction Mechanism

Carbamoyl Phosphate Synthetase I Mechanism  
Argininosuccinate Synthetase Mechanism

### **Chapter 19 Oxidative Phosphorylation and Photophosphorylation**

Living Graph: Free-Energy Change for  
Transport of an Ion  
Molecular Structure Tutorial: Bacteriorhodopsin

### **Chapter 20 Carbohydrate Biosynthesis in Plants and Bacteria**

Mechanism Animation: Rubisco Mechanism

### **Chapter 22 Biosynthesis of Amino Acids, Nucleotides, and Related Molecules**

Mechanism Animations:  
Tryptophan Synthase Mechanism  
Thymidylate Synthase Mechanism

### **Chapter 24 Genes and Chromosomes**

Animation: Three-Dimensional Packaging of  
Nuclear Chromosomes

### **Chapter 25 DNA Metabolism**

Molecular Structure Tutorial: Restriction  
Endonucleases  
Animation:  
Nucleotide Polymerization by DNA Polymerase  
DNA Synthesis

### **Chapter 26 RNA Metabolism**

Animation: mRNA Splicing  
Molecular Structure Tutorial: Hammerhead  
Ribozyme  
Animation: Life Cycle of an mRNA

### **Chapter 28 Regulation of Gene Expression**

Molecular Structure Tutorial: Lac Repressor

# About the Authors

**David L. Nelson**, born in Fairmont, Minnesota, received his BS in Chemistry and Biology from St. Olaf College in 1964 and earned his PhD in Biochemistry at Stanford Medical School under Arthur Kornberg. He was a postdoctoral fellow at the Harvard Medical School with Eugene P. Kennedy, who was one of Albert Lehninger's first graduate students. Nelson joined the faculty of the University of Wisconsin–Madison in 1971 and became a full professor of biochemistry in 1982. He was for eight years the Director of the Center for Biology Education at the University of Wisconsin–Madison.

Nelson's research has focused on the signal transductions that regulate ciliary motion and exocytosis in the protozoan *Paramecium*. The enzymes of signal transductions, including a variety of protein kinases, are primary targets of study. His research group has used enzyme purification, immunological techniques, electron microscopy, genetics, molecular biology, and electrophysiology to study these processes.

Dave Nelson has a distinguished record as a lecturer and research supervisor. For 40 years he has taught an intensive survey of biochemistry for advanced biochemistry undergraduates in the life sciences. He has also taught a survey of biochemistry for nursing students, and graduate courses on membrane structure and function and on molecular neurobiology. He has sponsored numerous PhD, MS, and undergraduate honors theses and has received awards for his outstanding teaching, including the Dreyfus Teacher–Scholar Award, the Atwood Distinguished Professorship, and the Unterkofler Excellence in Teaching Award from the University of Wisconsin System. In 1991–1992 he was a visiting professor of chemistry and biology at Spelman College. His second love is history, and in his dotage he has begun to teach the history of biochemistry to undergraduates and to collect antique scientific instruments for use in a laboratory course he teaches.

**Michael M. Cox** was born in Wilmington, Delaware. In his first biochemistry course, Lehninger's *Biochemistry* was a major influence in refocusing his fascination with biology and inspiring him to pursue a career in biochemistry. After graduating from the University of Delaware in 1974, Cox went to Brandeis University to do his doctoral work with William P. Jencks, and then to Stanford in 1979 for postdoctoral study with I. Robert Lehman. He moved to the University of Wisconsin–Madison in 1983 and became a full professor of biochemistry in 1992.

Cox's doctoral research was on general acid and base catalysis as a model for enzyme-catalyzed reactions. At Stanford, he began work on the enzymes involved in genetic recombination. The work focused

David L. Nelson and Michael M. Cox

particularly on the RecA protein, designing purification and assay methods that are still in use, and illuminating the process of DNA branch migration. Exploration of the enzymes of genetic recombination has remained the central theme of his research.

Mike Cox has coordinated a large and active research team at Wisconsin, investigating the enzymology, topology, and energetics of genetic recombination. A primary focus has been the mechanism of RecA protein-mediated DNA strand exchange, the role of ATP in the RecA system, and the regulation of recombinational DNA repair. Part of the research program now focuses on organisms that exhibit an especially robust capacity for DNA repair, such as *Deinococcus radiodurans*, and the applications of those repair systems to biotechnology.

For almost 30 years he has taught (with Dave Nelson) the survey of biochemistry to undergraduates and has lectured in graduate courses on DNA structure and topology, protein-DNA interactions, and the biochemistry of recombination. More recent projects have been the organization of a new course on professional responsibility for first-year graduate students and the establishment of a systematic program to draw talented biochemistry undergraduates into the laboratory at an early stage of their collegiate career. He has received awards for both his teaching and his research, including the Dreyfus Teacher–Scholar Award, the 1989 Eli Lilly Award in Biological Chemistry, and the 2009 Regents Teaching Excellence Award from the University of Wisconsin. He is also highly active in national efforts to provide new guidelines for undergraduate biochemistry education. His hobbies include turning 18 acres of Wisconsin farmland into an arboretum, wine collecting, and assisting in the design of laboratory buildings.

# A Note on the Nature of Science

In this twenty-first century, a typical science education often leaves the philosophical underpinnings of science unstated, or relies on oversimplified definitions. As you contemplate a career in science, it may be useful to consider once again the terms **science**, **scientist**, and **scientific method**.

**Science** is both a way of thinking about the natural world and the sum of the information and theory that result from such thinking. The power and success of science flow directly from its reliance on ideas that can be tested: information on natural phenomena that can be observed, measured, and reproduced and theories that have predictive value. The progress of science rests on a foundational assumption that is often unstated but crucial to the enterprise: that the laws governing forces and phenomena existing in the universe are not subject to change. The Nobel laureate Jacques Monod referred to this underlying assumption as the “postulate of objectivity.” The natural world can therefore be understood by applying a process of inquiry—the scientific method. Science could not succeed in a universe that played tricks on us. Other than the postulate of objectivity, science makes no inviolate assumptions about the natural world. A useful scientific idea is one that (1) has been or can be reproducibly substantiated and (2) can be used to accurately predict new phenomena.

Scientific ideas take many forms. The terms that scientists use to describe these forms have meanings quite different from those applied by nonscientists. A *hypothesis* is an idea or assumption that provides a reasonable and testable explanation for one or more observations, but it may lack extensive experimental substantiation. A *scientific theory* is much more than a hunch. It is an idea that has been substantiated to some extent and provides an explanation for a body of experimental observations. A theory can be tested and built upon and is thus a basis for further advance and innovation. When a scientific theory has been repeatedly tested and validated on many fronts, it can be accepted as a fact.

In one important sense, what constitutes science or a scientific idea is defined by whether or not it is published in the scientific literature after peer review by other working scientists. About 16,000 peer-reviewed scientific journals worldwide publish some 1.4 million articles each year, a continuing rich harvest of information that is the birthright of every human being.

**Scientists** are individuals who rigorously apply the scientific method to understand the natural world. Merely having an advanced degree in a scientific discipline does not make one a scientist, nor does the lack of such a degree prevent one from making important scientific contributions. A scientist must be willing to challenge any idea when new findings demand it. The

ideas that a scientist accepts must be based on measurable, reproducible observations, and the scientist must report these observations with complete honesty.

The **scientific method** is actually a collection of paths, all of which may lead to scientific discovery. In the *hypothesis and experiment* path, a scientist poses a hypothesis, then subjects it to experimental test. Many of the processes that biochemists work with every day were discovered in this manner. The DNA structure elucidated by James Watson and Francis Crick led to the hypothesis that base pairing is the basis for information transfer in polynucleotide synthesis. This hypothesis helped inspire the discovery of DNA and RNA polymerases.

Watson and Crick produced their DNA structure through a process of *model building and calculation*. No actual experiments were involved, although the model building and calculations used data collected by other scientists. Many adventurous scientists have applied the process of *exploration and observation* as a path to discovery. Historical voyages of discovery (Charles Darwin’s 1831 voyage on H.M.S. *Beagle* among them) helped to map the planet, catalog its living occupants, and change the way we view the world. Modern scientists follow a similar path when they explore the ocean depths or launch probes to other planets. An analog of hypothesis and experiment is *hypothesis and deduction*. Crick reasoned that there must be an adaptor molecule that facilitated translation of the information in messenger RNA into protein. This adaptor hypothesis led to the discovery of transfer RNA by Mahlon Hoagland and Paul Zamecnik.

Not all paths to discovery involve planning. *Serendipity* often plays a role. The discovery of penicillin by Alexander Fleming in 1928 and of RNA catalysts by Thomas Cech in the early 1980s were both chance discoveries, albeit by scientists well prepared to exploit them. *Inspiration* can also lead to important advances. The polymerase chain reaction (PCR), now a central part of biotechnology, was developed by Kary Mullis after a flash of inspiration during a road trip in northern California in 1983.

These many paths to scientific discovery can seem quite different, but they have some important things in common. They are focused on the natural world. They rely on *reproducible observation* and/or *experiment*. All of the ideas, insights, and experimental facts that arise from these endeavors can be tested and reproduced by scientists anywhere in the world. All can be used by other scientists to build new hypotheses and make new discoveries. All lead to information that is properly included in the realm of science. Understanding our universe requires hard work. At the same time, no human endeavor is more exciting and potentially rewarding than trying, and occasionally succeeding, to understand some part of the natural world.

# Preface

As we complete our work on this sixth edition of *Lehninger Principles of Biochemistry*, we are again struck by the remarkable changes in the field of biochemistry that have occurred between editions. The sheer volume of new information from high-throughput DNA sequencing, x-ray crystallography, and the manipulation of genes and gene expression, to cite only three examples, challenges both the seasoned researcher and the first-time biochemistry student. Our goal here is to strike a balance: to include new and exciting research findings without making the book overwhelming for students. The primary criterion for inclusion is that the new finding helps to illustrate an important *principle of biochemistry*.

The image on our cover, a map of the known metabolic transformations in a mitochondrion, illustrates the richness of factual material now available about biochemical transformations. We can no longer treat metabolic “pathways” as though they occurred in isolation; a single metabolite may be simultaneously part of many pathways in a three-dimensional network of metabolic transformations. Biochemical research focuses more and more upon the interactions among these pathways, the regulation of their interactions at the level of gene and protein, and the effects of regulation upon the activities of a whole cell or organism.

This edition of *LPOB* reflects these realities. Much of the new material that we have added reflects our increasingly sophisticated understanding of regulatory mechanisms, including those involved in altering the synthesis of enzymes and their degradation, those responsible for the control and timing of DNA synthesis and the cell cycle, and those that integrate the metabolism of carbohydrates, fats, and proteins over time in response to changes in the environment and in different cell types.

Even as we strive to incorporate the latest major advances, certain hallmarks of the book remain unchanged. We continue to emphasize the relevance of biochemistry

to the molecular mechanisms of disease, highlighting the special role that biochemistry plays in advancing human health and welfare. A special theme is the metabolic basis of diabetes and the factors that predispose to the disease. This theme is interwoven through many chapters and serves to integrate the discussion of metabolism. We also underscore the importance of evolution to biochemistry. Evolutionary theory is the bedrock upon which all biological sciences rest, and we have not wasted opportunities to highlight its important role in our discipline.

To a significant degree, research progress in biochemistry runs in parallel with the development of better tools and techniques. We have therefore highlighted some of these crucial developments. Chapter 9, DNA-Based Information Technologies, in particular, has been significantly revised to include the latest advances in genomics and next-generation sequencing.

Finally, we have devoted considerable attention to making the text and the art even more useful to students learning biochemistry for the first time. To those familiar with the book, some of these changes will be obvious as soon as you crack the cover.

With every revision of this textbook, we have striven to maintain the qualities that made the original Lehninger text a classic—clear writing, careful explanations of difficult concepts, and insightful communication to students of the ways in which biochemistry is understood and practiced today. The authors have written together for almost 25 years and taught introductory biochemistry together for nearly 30. Our thousands of students at the University of Wisconsin–Madison over those years have been an endless source of ideas about how to present biochemistry more clearly; they have enlightened and inspired us. We hope that this sixth edition of *Lehninger* will in turn enlighten and inspire current students of biochemistry everywhere, and perhaps lead some of them to love biochemistry as we do.

## New Art

The most obvious change to the book is the completely revamped art program. Our goal throughout has been to improve pedagogy, drawing on modern graphic resources to make our subject as clear as humanly possible. Many figures illustrate new topics, and much of the art has been reconceived and modernized in style. Defining features of the new art program include:

- ▶ **Smarter renditions of classic figures** are easier to interpret and learn from;

Chaperonins in protein folding

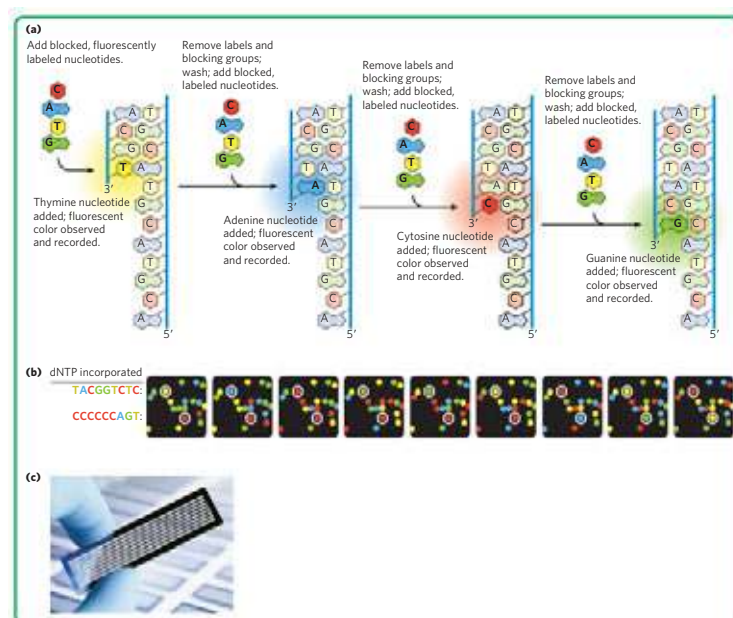

- **Figures that pair molecular models with schematic cartoons**, generated specifically for this book, use shapes and color schemes that are internally consistent;
- Figures with **numbered, annotated steps** help explain complex processes; in many cases, we have moved descriptive text out of the legends and into the figure itself;
- **Summary figures** help the student to keep the big picture in mind while learning the specifics.

Fuel metabolism in the liver during prolonged fasting or in uncontrolled diabetes mellitus

## Updated Genomics

Modern genomic techniques have transformed our understanding of biochemistry. In this edition, we have dramatically updated our coverage of genomic methods and their applications. Chapter 9, DNA-Based Information Technologies, has been completely revised to incorporate the latest genomic methods. Many other chapters have been updated to reflect advances gained from these methods. Among the new genomic methods discussed in this edition are:

- Next-generation DNA sequencing, including the Illumina and 454 sequencing methods and platforms (Chapter 9)
- Applications of genomics, including the use of haplotypes to trace human migrations and phylogenetics to locate human genes associated with inherited diseases (Chapter 9)
- Forensic genotyping and the use of personalized genomics in medicine (Chapter 9)

Next-generation reversible terminator sequencing

## New Science

Every chapter has been thoroughly revised and updated to include both the most important advances in biochemistry and information needed in a modern biochemistry text. Among the new and updated topics in this edition are:

- Prebiotic evolution, black smokers, and the RNA world (Chapter 1)
- Intrinsically disordered proteins (Chapter 4)
- Transition-state analogs and irreversible inhibition (Chapter 6)
- Blood coagulation pathways in the context of enzymatic regulation (Chapter 6)

Binding of the intrinsically disordered carboxyl terminus of p53 to its binding partners

- ▶ Asymmetric lipid distribution in bilayers (Chapter 11)
- ▶ Role of BAR superfamily proteins in membrane curvature (Chapter 11)
- ▶ Scaffold proteins (AKAPS and others) and their regulatory roles (Chapter 12)
- ▶ Reactive oxygen species as byproducts and as signals (Chapter 19)
- ▶ Structure and function of the oxygen-evolving metal cluster in PSII (Chapter 19)
- ▶ Formation and transport of lipoproteins in mammals, including the roles of SREBP SCAP, and Insig in cholesterol regulation (Chapter 21)
- ▶ Integration of carbohydrate and lipid metabolism by PPARs, SREBPs, mTORC1, and LXR (Chapters 21, 23)
- ▶ Creatine phosphate and the role of creatine kinase in moving ATP to the cytosol (Chapter 23)
- ▶ Microbial symbionts in the gut and their influence on energy metabolism and adipogenesis (Chapter 23)
- ▶ Nucleosomes: their modification and positioning and higher-order chromatin structure (Chapter 24)
- ▶ DNA polymerases and homologous recombination (Chapter 25)
- ▶ Loading of eukaryotic RNA polymerase II (Chapter 26)
- ▶ Mutation-resistant nature of the genetic code (Chapter 27)
- ▶ Regulation of eukaryotic gene expression by miRNAs (Chapters 26 and 28).
- ▶ DNA looping, combinatorial control, chromatin remodeling, and positive regulation in eukaryotes (Chapter 28)
- ▶ Regulation of the initiation of transcription in eukaryotes (Chapter 28)
- ▶ Steroid-binding nuclear receptors (Chapter 28)

## New Biochemical Methods

An appreciation of biochemistry often requires an understanding of how biochemical information is obtained. Some of the new methods or updates described in this edition are:

- ▶ Modern Sanger protein sequencing and mass spectrometry (Chapter 3)
- ▶ Mass spectrometry applied to proteomics, glycomics, lipidomics, and metabolomics (Chapters 3, 7, 10)
- ▶ Oligosaccharide microarrays to explore protein-oligosaccharide interactions and the “carbohydrate code” (Chapter 7)
- ▶ Modern genomic methods (Chapter 9)
- ▶ Genetic engineering of photosynthetic organisms (Chapter 20)
- ▶ Use of positron emission tomography (PET) to visualize tumors and brown adipose tissue (Chapter 23)
- ▶ Development of bacterial strains with altered genetic codes for site-specific insertion of novel amino acids into proteins (Chapter 27)

## New Medical Applications

This icon is used throughout the book to denote material of special medical interest. As teachers, our goal is for students to learn biochemistry and to understand its relevance to a healthier life and a healthier planet. Many sections explore what we know about the molecular mechanisms of disease. A few of the new or revised medical applications in this edition are:

- ▶ Box 4-6, Death by Misfolding: The Prion Diseases
- ▶ Paganini and Ehlers-Danlos syndrome (Chapter 4)
- ▶ HIV protease inhibitors and how basic enzymatic principles influenced their design (Chapter 6)
- ▶ Blood coagulation cascade and hemophilia (Chapter 6)
- ▶ Curing African sleeping sickness with an enzymatic suicide inhibitor (Chapter 6)
- ▶ How researchers locate human genes involved in inherited diseases (Chapter 9)
- ▶ Multidrug resistance transporters and their importance in clinical medicine (Chapter 11)
- ▶ Multistep progression to colorectal cancer (Chapter 12)
- ▶ Cholesterol metabolism, cardiovascular disease, and mechanism of plaque formation in atherosclerosis (Chapter 21)
- ▶ P-450 and drug interactions (Chapter 21)
- ▶ HMG-CoA reductase (Chapter 21) and Box 21-3, The Lipid Hypothesis and the Development of Statins
- ▶ Box 24-1, Curing Disease by Inhibiting Topoisomerases, describing the use of topoisomerase inhibitors in the treatment of bacterial infections and cancer, including material on ciprofloxacin (the antibiotic effective for anthrax)
- ▶ Stem cells (Chapter 28)

## Special Theme: Understanding Metabolism through Obesity and Diabetes

Obesity and its medical consequences—cardiovascular disease and diabetes—are fast becoming epidemic in the industrialized world, and we include new material on the biochemical connections between obesity and health throughout this edition. Our focus on diabetes provides an integrating theme throughout the chapters on metabolism and its control, and this will, we hope, inspire some students to find solutions for this disease. Some of the sections and boxes that highlight the interplay of metabolism, obesity, and diabetes are:

- ▶ Untreated Diabetes Produces Life-Threatening Acidosis (Chapter 2)
- ▶ Box 7–1, Blood Glucose Measurements in the Diagnosis and Treatment of Diabetes, introduces hemoglobin glycation and AGEs and their role in the pathology of advanced diabetes
- ▶ Glucose Uptake Is Deficient in Type 1 Diabetes Mellitus (Chapter 14)
- ▶ Ketone Bodies Are Overproduced in Diabetes and during Starvation (Chapter 17)
- ▶ Some Mutations in Mitochondrial Genomes Cause Disease (Chapter 19)
- ▶ Diabetes Can Result from Defects in the Mitochondria of Pancreatic  $\beta$  Cells (Chapter 19)

- ▶ Adipose Tissue Generates Glycerol 3-phosphate by Glyceroneogenesis (Chapter 21)
- ▶ Diabetes Mellitus Arises from Defects in Insulin Production or Action (Chapter 23)
- ▶ Section 23.4, Obesity and the Regulation of Body Mass, includes a new discussion of the roles of TORC1 in regulating cell growth
- ▶ Section 23.5, Obesity, the Metabolic Syndrome, and Type 2 Diabetes, discusses the role of ectopic lipids and inflammation in the development of insulin resistance and the management of type 2 diabetes with exercise, diet, and medication

Overloading adipocytes with triacylglycerols triggers inflammation in fat tissue, ectopic lipid deposition, and insulin resistance.

## Special Theme: Evolution

Every time a biochemist studies a developmental pathway in nematodes, identifies key parts of an enzyme active site by determining what parts are conserved between species, or searches for the gene underlying a human genetic disease, he or she is relying on evolutionary theory. Funding agencies support the work in nematodes knowing that the insights will be relevant to humans. The conservation of functional residues in an enzyme active site telegraphs the shared history of every organism on the planet. More often than not, the search for a disease gene is a sophisticated exercise in phylogenetics. Evolution is thus a foundational concept to our discipline. Some of the many sections and boxes that deal with evolution include:

- ▶ Section 1.5, Evolutionary Foundations, discusses how life may have evolved and recounts some of the early milestones in the evolution of eukaryotic cells
- ▶ Genome Sequencing Informs Us about Our Humanity (Chapter 9)
- ▶ Genome Comparisons Help Locate Genes Involved in Disease (Chapter 9)
- ▶ Genome Sequences Inform Us about Our Past and Provide Opportunities for the Future (Chapter 9)
- ▶ Box 9–3, Getting to Know the Neanderthals
- ▶ ABC Transporters Use ATP to Drive the Active Transport of a Wide Variety of Substrates (Chapter 11)
- ▶ Signaling Systems of Plants Have Some of the Same Components Used by Microbes and Mammals (Chapter 12)
- ▶ The  $\beta$ -Oxidation Enzymes of Different Organelles Have Diverged during Evolution (Chapter 17)
- ▶ Section 19.10, The Evolution of Oxygenic Photosynthesis
- ▶ Mitochondria and Chloroplasts Evolved from Endosymbiotic Bacteria (Chapter 19)
- ▶ Photosystems I and II Evolved from Bacterial Photosystems (Chapter 19)
- ▶ RNA Synthesis Offers Important Clues to Biochemical Evolution (Chapter 26)
- ▶ Box 27–1, Exceptions That Prove the Rule: Natural Variations in the Genetic Code
- ▶ Box 27–2, From an RNA World to a Protein World
- ▶ Box 28–1, Of Fins, Wings, Beaks, and Things

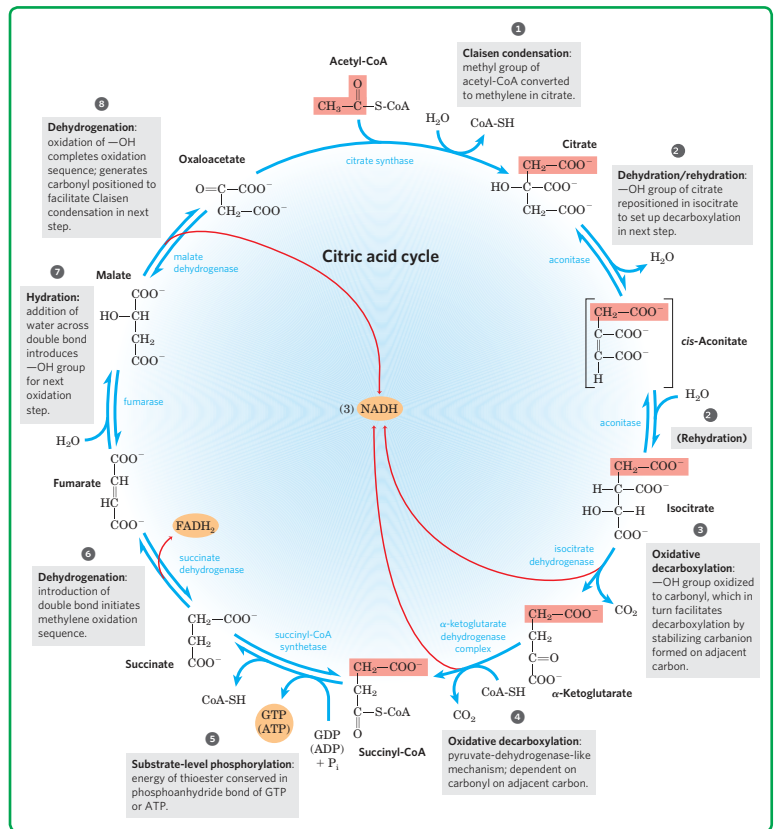

## Lehninger Teaching Hallmarks

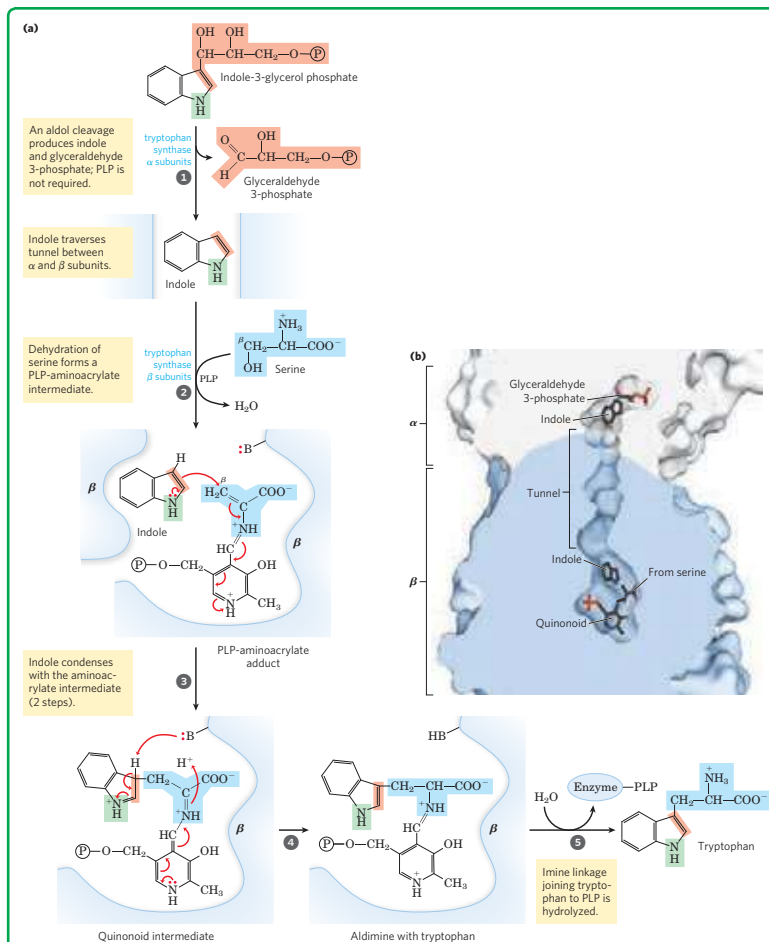

Students encountering biochemistry for the first time often have difficulty with two key aspects of the course: approaching quantitative problems and drawing on what they learned in organic chemistry to help them understand biochemistry. Those same students must also learn a complex language, with conventions that are often unstated. To help students cope with these challenges, we provide the following study aids:

### Focus on Chemical Logic

- ▶ Section 13.2, **Chemical Logic and Common Biochemical Reactions**, discusses the common biochemical reaction types that underlie all metabolic reactions, helping students to connect organic chemistry with biochemistry.
- ▶ **NEW chemical logic figures** highlight the conservation of mechanism and illustrate patterns that make learning pathways easier. Chemical logic figures are provided for each of the central metabolic pathways, including glycolysis (Fig. 14–3), citric acid cycle (Fig. 16–7), and fatty acid oxidation (Fig. 17–9).

Reactions of the citric acid cycle

- ▶ **Mechanism figures** feature step-by-step descriptions to help students understand the reaction process. These figures use a consistent set of conventions introduced and explained in detail with the first enzyme mechanism encountered (chymotrypsin, pp. 216–217).

Tryptophan synthase reaction

## Problem-Solving Tools

- ▶ **In-text Worked Examples** help students improve their quantitative problem-solving skills, taking them through some of the most difficult equations. New worked examples appear in Chapters 1, 2, and 19.
- ▶ **More than 600 end-of-chapter problems (about 25 of them new)** give students further opportunity to practice what they have learned.
- ▶ **Data Analysis Problems** (one at the end of each chapter), contributed by Brian White of the University of Massachusetts–Boston, encourage students to synthesize what they have learned and apply their knowledge to the interpretation of data from the literature.

## Key Conventions

Many of the conventions that are so necessary for understanding each biochemical topic and the biochemical literature are broken out of the text and highlighted. These **Key Conventions** include clear statements of many assumptions and conventions that students are often expected to assimilate without being told (for example, peptide sequences are written from amino- to carboxyl-terminal end, left to right; nucleotide sequences are written from 5' to 3' end, left to right).

## Media and Supplements

A full package of media resources and supplements provides instructors and students with innovative tools to support a variety of teaching and learning approaches. All these resources are fully integrated with the style and goals of the sixth-edition textbook.

### \*NEW\* BiochemPortal ([courses.bfwpub.com/lehninger6e](https://courses.bfwpub.com/lehninger6e))

This comprehensive and robust online teaching and learning tool incorporates the e-Book, all instructor and student resources, instructor assignment and gradebook functionality, and a new LearningCurve quizzing tool.

- ▶ BiochemPortal includes the **e-Book**, with the full contents of the text, highlighting and note-taking tools, and links to important media assets (listed below).
- ▶ In addition to all **instructor resources** (listed below), BiochemPortal provides instructors with the **ability to assign** any resource, as well as e-Book readings, discussion board posts, and their own materials. A gradebook tracks all student scores and can be easily exported to Excel or a campus Course Management System.
- ▶ **New** BiochemPortal also includes **LearningCurve**, a self-paced adaptive quizzing tool. With questions tailored to students' target difficulty level and an engaging scoring system, LearningCurve encourages students to incorporate content from

### WORKED EXAMPLE 19-2 Stoichiometry of ATP Production: Effect of c Ring Size

(a) If *bovine* mitochondria have 8 c subunits per c ring, what is the predicted ratio of ATP formed per NADH oxidized? (b) What is the predicted value for *yeast* mitochondria, with 10 c subunits? (c) What are the comparable values for electrons entering the respiratory chain from FADH<sub>2</sub>?

**Solution:** (a) The question asks us to determine how many ATP are produced per NADH. This is another way of asking us to calculate the P/O ratio, or  $x$  in Equation 19-11. If the c ring has 8 c subunits, then one full rotation will transfer 8 protons to the matrix and produce 3 ATP molecules. But this synthesis also requires the transport of 3 P<sub>i</sub> into the matrix, at a cost of 1 proton each, adding 3 more protons to the total number required. This brings the total cost to (11 protons)/(3 ATP) = 3.7 protons/ATP. The consensus value for the number of protons pumped out per pair of electrons transferred from NADH is 10 (see Fig. 19-19). So, oxidizing 1 NADH produces (10 protons)/(3.7 protons/ATP) = 2.7 ATP.

(b) If the c ring has 10 c subunits, then one full rotation will transfer 10 protons to the matrix and produce 3 ATP molecules. Adding in the 3 protons to transport the 3 P<sub>i</sub> into the matrix brings the total cost to (13 protons)/(3 ATP) = 4.3 protons/ATP. Oxidizing 1 NADH produces (10 protons)/(4.3 protons/ATP) = 2.3 ATP.

(c) When electrons enter the respiratory chain from FADH<sub>2</sub> (at ubiquinone), only 6 protons are available to drive ATP synthesis. This changes the calculation for bovine mitochondria to (6 protons)/(3.7 protons/ATP) = 1.6 ATP per pair of electrons from FADH<sub>2</sub>. For yeast mitochondria, the calculation is (6 protons)/(4.3 protons/ATP) = 1.4 ATP per pair of electrons from FADH<sub>2</sub>.

These calculated values of  $x$  or the P/O ratio define a range that includes the experimental values of 2.5 ATP/NADH and 1.5 ATP/FADH<sub>2</sub>, and we therefore use these values throughout this book.

the text into their study routine and provides them with a study plan on completion.

- ▶ Students can access any of the **student resources** provided with the text (see below) through links in the e-Book or the handy Resources tab.

### e-Book ([ebooks.bfwpub.com/lehninger6e](https://ebooks.bfwpub.com/lehninger6e))

This online version of the textbook combines the contents of the printed book with electronic study tools and a full complement of student media specifically created to support the text. The e-Book also provides useful material for instructors.

- ▶ **e-Book study tools** include instant navigation to any section or page of the book, bookmarks, highlighting, note-taking, instant search for any term, pop-up key-term definitions, and a spoken glossary.
- ▶ The text-specific **student media**, fully integrated throughout the e-Book, include animated enzyme mechanisms, animated biochemical techniques, problem-solving videos, molecular structure tutorials in Jmol, Protein Data Bank IDs in Jmol, and Living Graphs (each described under "Student Resources" below).
- ▶ **Instructor features** include the ability to add notes or files to any page and to share these notes with students. Notes may include text, Web links, animations, or photos. Instructors can also assign the entire text or a custom version of the e-Book.

## Instructor Resources

Instructors are provided with a comprehensive set of teaching tools, each developed to support the text, lecture presentations, and individual teaching styles. All instructor media are available for download on the **book website** ([www.whfreeman.com/lehnninger6e](http://www.whfreeman.com/lehnninger6e)) and on the **Instructor Resource DVD** (ISBN 1-4641-0969-9).

► **New clicker questions** provide instructors with dynamic multiple-choice questions to be used with iClicker or other classroom response systems. The clicker questions have been written specifically to foster active learning in the classroom and better inform instructors on student misunderstandings.

► **Fully optimized JPEG files** of every figure, photo, and table in the text feature enhanced color, higher resolution, and enlarged fonts. The files have been reviewed by course instructors and tested in a large lecture hall to ensure maximum clarity and visibility. The JPEGs are also offered in separate files and in **PowerPoint** format for each chapter.

► **Animated Enzyme Mechanisms** and **Animated Biochemical Techniques** are available in Flash files and preloaded into PowerPoint, in both PC and Macintosh formats, for lecture presentation.

► A list of **Protein Data Bank IDs** for the structures in the text are arranged by figure number. A new feature in this edition is an index to all structures in the Jmol interactive Web browser applet.

► **Living Graphs**, illustrating key equations from the textbook, show the graphic results of changing parameters.

► A comprehensive **Test Bank** in PDF and editable Word formats includes 150 multiple-choice and short-answer problems per chapter, rated by level of difficulty.

## Student Resources

Students are provided with media designed to enhance their understanding of biochemical principles and improve their problem-solving ability. All student media, along with the **PDB Structures** and **Living Graphs**, are also in the e-Book, and many are available on the book website ([www.whfreeman.com/lehnninger6e](http://www.whfreeman.com/lehnninger6e)).  Icons in the text indicate the availability of relevant animation, Living Graph, or Molecular Structure Tutorial.

► **Problem-Solving Videos**, created by Scott Ensign of Utah State University, provide 24/7 online

problem-solving help to students. Through a two-part approach, each 10-minute video covers a key textbook problem representing a topic that students traditionally struggle to master. Dr. Ensign first describes a proven problem-solving strategy and then applies the strategy to the problem at hand in clear, concise steps. Students can easily pause, rewind, and review any steps as they wish until they firmly grasp not just the solution but also the reasoning behind it. Working through the problems in this way is designed to make students better and more confident at applying key strategies as they solve other textbook and exam problems.

► Student versions of the **Animated Enzyme Mechanisms** and **Animated Biochemical Techniques** help students understand key mechanisms and techniques at their own pace.

Protein Architecture Molecular Structure Tutorial

► **Molecular Structure Tutorials**, using the Jmol-Web browser applet, allow students to explore in more depth the molecular structures included in the textbook, including:

Protein Architecture

Bacteriorhodopsin

Lac Repressor

Nucleotides

MHC Molecules

Trimeric G Proteins

Oxygen-Binding Proteins

Restriction Endonucleases

Hammerhead Ribozyme

*The Absolute, Ultimate Guide to Lehninger Principles of Biochemistry, Sixth Edition, Study Guide and Solutions Manual*, by Marcy Osgood (University of New Mexico School of Medicine) and Karen Ocorr (Sanford-Burnham Medical Research Institute); ISBN 1429294760

*The Absolute, Ultimate Guide* combines an innovative study guide with a reliable solutions manual (providing extended solutions to end-of-chapter problems) in one convenient volume. Thoroughly class-tested, the study guide includes for each chapter:

- ▶ **Major Concepts:** a road map through the chapter
- ▶ **What to Review:** questions that recap key points from previous chapters
- ▶ **Discussion Questions:** provided for each section; designed for individual review, study groups, or classroom discussion
- ▶ **A Self-Test:** “Do you know the terms?”; crossword puzzles; multiple-choice, fact-driven questions; and questions that ask students to apply their new knowledge in new directions—plus answers!

## Acknowledgments

This book is a team effort, and producing it would be impossible without the outstanding people at W. H. Freeman and Company who supported us at every step along the way. Susan Moran (Senior Developmental Editor), Susan Winslow (Publisher), and Lauren Schultz (Senior Acquisitions Editor) helped develop the revision plan for this edition, made many helpful suggestions, encouraged us, and tried valiantly (if not always successfully) to keep us on schedule. Matthew Tontono (Developmental Editor) provided extremely helpful feedback on many chapters. Our outstanding Project Editor, Jane O'Neill, somehow kept the book moving through production in spite of our missed deadlines and last-minute changes, and did so with her usual grace and skill. We thank Art Director Diana Blume for her artistry in designing both the text and cover for the book. We appreciate the work of present and past copyeditors, including Karen Taschek, Liz Geller, and Linda Strange. Although Linda did not copyedit this edition, her lasting contributions from the first through the fifth editions are still clearly evident in the text. We thank Photo Research Manager Ted Szczepanski and Photo Researcher Elyse Rieder for their help in locating images and Courtney Lyons for help in orchestrating reviews and providing administrative assistance at many turns. We also thank Allison Michael, Media Editor, for assembling the ever more important media components to accompany the text. Our gratitude also goes to Debbie Clare, Associate Director of Marketing, for her creativity and good humor in coordinating the sales and marketing effort. A very special thanks goes to Kate Parker, who oversaw this project for the past three editions, and contributed much to its success, before moving on to other things; we will miss her insight, humor, and excellent taste in restaurants.

In Madison, Brook Soltvedt is (and has been for all the editions we have worked on) our first-line editor and critic. She is the first to see manuscript chapters, aids in manuscript and art development, ensures internal consistency in content and nomenclature, and keeps us on task with more-or-less gentle prodding. As she did

for the fourth and fifth editions, Shelley Lusetti of New Mexico State University read every word of the text in proofs, caught numerous mistakes, and made many suggestions that improved the book.

The new art in this edition, including the new molecular graphics, was done by Adam Steinberg, here in Madison, who often made valuable suggestions that led to better and clearer illustrations. We feel very fortunate to have such gifted partners as Brook, Shelley, and Adam on our team.

We are also deeply indebted to Brian White of the University of Massachusetts–Boston, who wrote the data analysis problems at the end of each chapter.

Many colleagues played a special role through their interest in the project and their timely input. Prominent among these are Jeffrey D. Esko of the University of California, San Diego; and Jack Kirsch and his students at the University of California, Berkeley. Charles G. Hoogstraten of Michigan State University made many incisive and helpful comments on the manuscript and figures. We also thank Jeffrey A. Cohlberg of California State University at Long Beach for his critical comments. Many others helped us shape this sixth edition with their comments, suggestions, and criticisms. To all of them, we are deeply grateful:

We lack the space here to acknowledge all the other individuals whose special efforts went into this book. We offer instead our sincere thanks—and the finished book that they helped guide to completion. We, of course, assume full responsibility for errors of fact or emphasis.

We want especially to thank our students at the University of Wisconsin–Madison for their numerous comments and suggestions. If something in the book does not work, they are never shy about letting us know it. We are grateful to the students and staff of our research groups, who helped us balance the competing demands on our time; to our colleagues in the Department of Biochemistry at the University of Wisconsin–Madison, who helped us with advice and criticism; and to the many students and teachers who have written to suggest ways of improving the book. We hope our readers will continue to provide input for future editions.

Finally, we express our deepest appreciation to our wives, Brook and Beth, and our families, who showed extraordinary patience with, and support for, our book writing.

David L. Nelson

<b>1 The Foundations of Biochemistry</b>	<b>1</b>
<b>1.1 Cellular Foundations</b>	<b>2</b>
Cells Are the Structural and Functional Units of All Living Organisms	3
Cellular Dimensions Are Limited by Diffusion	3
There Are Three Distinct Domains of Life	3
Organisms Differ Widely in Their Sources of Energy and Biosynthetic Precursors	4
Bacterial and Archaeal Cells Share Common Features but Differ in Important Ways	4
Eukaryotic Cells Have a Variety of Membranous Organelles, Which Can Be Isolated for Study	6
The Cytoplasm Is Organized by the Cytoskeleton and Is Highly Dynamic	8
Cells Build Supramolecular Structures	9
In Vitro Studies May Overlook Important Interactions among Molecules	9
<b>1.2 Chemical Foundations</b>	<b>11</b>
Biomolecules Are Compounds of Carbon with a Variety of Functional Groups	12
Cells Contain a Universal Set of Small Molecules	14
<b>BOX 1-1 Molecular Weight, Molecular Mass, and Their Correct Units</b>	<b>14</b>
Macromolecules Are the Major Constituents of Cells	15
Three-Dimensional Structure Is Described by Configuration and Conformation	16
<b>BOX 1-2 Louis Pasteur and Optical Activity: In Vino, Veritas</b>	<b>18</b>
Interactions between Biomolecules Are Stereospecific	19
<b>1.3 Physical Foundations</b>	<b>20</b>
Living Organisms Exist in a Dynamic Steady State, Never at Equilibrium with Their Surroundings	21
Organisms Transform Energy and Matter from Their Surroundings	21
<b>BOX 1-3 Entropy: Things Fall Apart</b>	<b>22</b>
The Flow of Electrons Provides Energy for Organisms	22
Creating and Maintaining Order Requires Work and Energy	22
Energy Coupling Links Reactions in Biology	24
$K_{eq}$ and $\Delta G^\circ$ Are Measures of a Reaction's Tendency to Proceed Spontaneously	25
Enzymes Promote Sequences of Chemical Reactions	27
Metabolism Is Regulated to Achieve Balance and Economy	28
<b>1.4 Genetic Foundations</b>	<b>29</b>
Genetic Continuity Is Vested in Single DNA Molecules	30
The Structure of DNA Allows for Its Replication and Repair with Near-Perfect Fidelity	30
The Linear Sequence in DNA Encodes Proteins with Three-Dimensional Structures	30

<b>1.5 Evolutionary Foundations</b>	<b>32</b>	<b>2.4 Water as a Reactant</b>	<b>69</b>
Changes in the Hereditary Instructions Allow Evolution	32	<b>2.5 The Fitness of the Aqueous Environment for Living Organisms</b>	<b>69</b>
Biomolecules First Arose by Chemical Evolution	33		
RNA or Related Precursors May Have Been the First Genes and Catalysts	34	<b>3 Amino Acids, Peptides, and Proteins</b>	<b>75</b>

<b>7.1 Monosaccharides and Disaccharides</b>	243	Double-Helical DNA and RNA Can Be Denatured	297
The Two Families of Monosaccharides Are Aldoses and Ketoses	244	Nucleic Acids from Different Species Can Form Hybrids	298
Monosaccharides Have Asymmetric Centers	244	Nucleotides and Nucleic Acids Undergo Nonenzymatic Transformations	299
The Common Monosaccharides Have Cyclic Structures	245	Some Bases of DNA Are Methylated	302
Organisms Contain a Variety of Hexose Derivatives	249	The Sequences of Long DNA Strands Can Be Determined	302
<b>BOX 7-1 MEDICINE: Blood Glucose Measurements in the Diagnosis and Treatment of Diabetes</b>	250	The Chemical Synthesis of DNA Has Been Automated	304
Monosaccharides Are Reducing Agents	251	<b>8.4 Other Functions of Nucleotides</b>	306
Disaccharides Contain a Glycosidic Bond	252	Nucleotides Carry Chemical Energy in Cells	306
<b>BOX 7-2 Sugar Is Sweet, and So Are . . . a Few Other Things</b>	254	Adenine Nucleotides Are Components of Many Enzyme Cofactors	306
<b>7.2 Polysaccharides</b>	254	Some Nucleotides Are Regulatory Molecules	308
Some Homopolysaccharides Are Stored Forms of Fuel	255		
Some Homopolysaccharides Serve Structural Roles	256		

<b>9 DNA-Based Information Technologies</b>	<b>313</b>		
<b>9.1 Studying Genes and Their Products</b>	<b>314</b>		
Genes Can Be Isolated by DNA Cloning	314		
Restriction Endonucleases and DNA Ligases Yield Recombinant DNA	314		
Cloning Vectors Allow Amplification of Inserted DNA Segments	317		
Cloned Genes Can Be Expressed to Amplify Protein Production	321		
Many Different Systems Are Used to Express Recombinant Proteins	322		
Alteration of Cloned Genes Produces Altered Proteins	323		
Terminal Tags Provide Handles for Affinity Purification	325		
Gene Sequences Can Be Amplified with the Polymerase Chain Reaction	327		
<b>BOX 9-1 METHODS: A Powerful Tool in Forensic Medicine</b>	<b>329</b>		
<b>9.2 Using DNA-Based Methods to Understand Protein Function</b>	<b>331</b>		
DNA Libraries Are Specialized Catalogs of Genetic Information	332		
Sequence or Structural Relationships Provide Information on Protein Function	333		
Fusion Proteins and Immunofluorescence Can Localize Proteins in Cells	333		
Protein-Protein Interactions Can Help Elucidate Protein Function	334		
DNA Microarrays Reveal RNA Expression Patterns and Other Information	337		
<b>9.3 Genomics and the Human Story</b>	<b>339</b>		
Genomic Sequencing Is Aided by New Generations of DNA-Sequencing Methods	339		
<b>BOX 9-2 MEDICINE: Personalized Genomic Medicine</b>	<b>340</b>		
The Human Genome Contains Genes and Many Other Types of Sequences	342		
Genome Sequencing Informs Us about Our Humanity	345		
Genome Comparisons Help Locate Genes Involved in Disease	347		
Genome Sequences Inform Us about Our Past and Provide Opportunities for the Future	349		
<b>BOX 9-3 Getting to Know the Neanderthals</b>	<b>350</b>		
<b>10 Lipids</b>	<b>357</b>		
<b>10.1 Storage Lipids</b>	<b>357</b>		
Fatty Acids Are Hydrocarbon Derivatives	357		
Triacylglycerols Are Fatty Acid Esters of Glycerol	360		
Triacylglycerols Provide Stored Energy and Insulation	360		
Partial Hydrogenation of Cooking Oils Produces Trans Fatty Acids	361		
Waxes Serve as Energy Stores and Water Repellents	362		
<b>10.2 Structural Lipids in Membranes</b>	<b>362</b>		
Glycerophospholipids Are Derivatives of Phosphatidic Acid	363		
		Some Glycerophospholipids Have Ether-Linked Fatty Acids	364
		Chloroplasts Contain Galactolipids and Sulfolipids	365
		Archaea Contain Unique Membrane Lipids	365
		Sphingolipids Are Derivatives of Sphingosine	366
		Sphingolipids at Cell Surfaces Are Sites of Biological Recognition	367
		Phospholipids and Sphingolipids Are Degraded in Lysosomes	368
		Sterols Have Four Fused Carbon Rings	368
		<b>BOX 10-1 MEDICINE: Abnormal Accumulations of Membrane Lipids: Some Inherited Human Diseases</b>	<b>369</b>
		<b>10.3 Lipids as Signals, Cofactors, and Pigments</b>	<b>370</b>
		Phosphatidylinositols and Sphingosine Derivatives Act as Intracellular Signals	370
		Eicosanoids Carry Messages to Nearby Cells	371
		Steroid Hormones Carry Messages between Tissues	372
		Vascular Plants Produce Thousands of Volatile Signals	372
		Vitamins A and D Are Hormone Precursors	373
		Vitamins E and K and the Lipid Quinones Are Oxidation-Reduction Cofactors	374
		Dolichols Activate Sugar Precursors for Biosynthesis	375
		Many Natural Pigments Are Lipidic Conjugated Dienes	376
		Polyketides Are Natural Products with Potent Biological Activities	376
		<b>10.4 Working with Lipids</b>	<b>377</b>
		Lipid Extraction Requires Organic Solvents	377
		Adsorption Chromatography Separates Lipids of Different Polarity	378
		Gas-Liquid Chromatography Resolves Mixtures of Volatile Lipid Derivatives	378
		Specific Hydrolysis Aids in Determination of Lipid Structure	378
		Mass Spectrometry Reveals Complete Lipid Structure	378
		Lipidomics Seeks to Catalog All Lipids and Their Functions	379
		<b>11 Biological Membranes and Transport</b>	<b>385</b>
		<b>11.1 The Composition and Architecture of Membranes</b>	<b>386</b>
		Each Type of Membrane Has Characteristic Lipids and Proteins	386
		All Biological Membranes Share Some Fundamental Properties	387
		A Lipid Bilayer Is the Basic Structural Element of Membranes	387
		Three Types of Membrane Proteins Differ in Their Association with the Membrane	389
		Many Membrane Proteins Span the Lipid Bilayer	390
		Integral Proteins Are Held in the Membrane by Hydrophobic Interactions with Lipids	390
		The Topology of an Integral Membrane Protein Can Sometimes Be Predicted from Its Sequence	391
		Covalently Attached Lipids Anchor Some Membrane Proteins	394

<b>11.2 Membrane Dynamics</b>	<b>395</b>	<b>BOX 12-2 MEDICINE: G Proteins: Binary Switches in Health and Disease</b>	<b>441</b>
Acyl Groups in the Bilayer Interior Are Ordered to Varying Degrees	395	Several Mechanisms Cause Termination of the $\beta$ -Adrenergic Response	444
Transbilayer Movement of Lipids Requires Catalysis	396	The $\beta$ -Adrenergic Receptor Is Desensitized by Phosphorylation and by Association with Arrestin	445
Lipids and Proteins Diffuse Laterally in the Bilayer	397	Cyclic AMP Acts as a Second Messenger for Many Regulatory Molecules	446
Sphingolipids and Cholesterol Cluster Together in Membrane Rafts	398	Diacylglycerol, Inositol Trisphosphate, and $\text{Ca}^{2+}$ Have Related Roles as Second Messengers	447
Membrane Curvature and Fusion Are Central to Many Biological Processes	399	<b>BOX 12-3 METHODS: FRET: Biochemistry Visualized in a Living Cell</b>	<b>448</b>
Integral Proteins of the Plasma Membrane Are Involved in Surface Adhesion, Signaling, and Other Cellular Processes	402	Calcium Is a Second Messenger That May Be Localized in Space and Time	451
<b>11.3 Solute Transport across Membranes</b>	<b>402</b>	GPCRs Mediate the Actions of a Wide Variety of Signals	452
Passive Transport Is Facilitated by Membrane Proteins	403	<b>12.3 Receptor Tyrosine Kinases</b>	<b>453</b>
Transporters and Ion Channels Are Fundamentally Different	404	Stimulation of the Insulin Receptor Initiates a Cascade of Protein Phosphorylation Reactions	453
The Glucose Transporter of Erythrocytes Mediates Passive Transport	405	The Membrane Phospholipid $\text{PIP}_3$ Functions at a Branch in Insulin Signaling	456
The Chloride-Bicarbonate Exchanger Catalyzes Electroneutral Cotransport of Anions across the Plasma Membrane	407	The JAK-STAT Signaling System Also Involves Tyrosine Kinase Activity	457
<b>BOX 11-1 MEDICINE: Defective Glucose and Water Transport in Two Forms of Diabetes</b>	<b>408</b>	Cross Talk among Signaling Systems Is Common and Complex	458
Active Transport Results in Solute Movement against a Concentration or Electrochemical Gradient	409	<b>12.4 Receptor Guanylyl Cyclases, cGMP, and Protein Kinase G</b>	<b>459</b>
P-Type ATPases Undergo Phosphorylation during Their Catalytic Cycles	410	<b>12.5 Multivalent Adaptor Proteins and Membrane Rafts</b>	<b>460</b>
V-Type and F-Type ATPases Are Reversible, ATP-Driven Proton Pumps	412	Protein Modules Bind Phosphorylated Tyr, Ser, or Thr Residues in Partner Proteins	460
ABC Transporters Use ATP to Drive the Active Transport of a Wide Variety of Substrates	413	Membrane Rafts and Caveolae May Segregate Signaling Proteins	463
Ion Gradients Provide the Energy for Secondary Active Transport	414	<b>12.6 Gated Ion Channels</b>	<b>464</b>
<b>BOX 11-2 MEDICINE: A Defective Ion Channel in Cystic Fibrosis</b>	<b>415</b>	Ion Channels Underlie Electrical Signaling in Excitable Cells	464
Aquaporins Form Hydrophilic Transmembrane Channels for the Passage of Water	418	Voltage-Gated Ion Channels Produce Neuronal Action Potentials	465
Ion-Selective Channels Allow Rapid Movement of Ions across Membranes	420	The Acetylcholine Receptor Is a Ligand-Gated Ion Channel	467
Ion-Channel Function Is Measured Electrically	421	Neurons Have Receptor Channels That Respond to Different Neurotransmitters	468
The Structure of a $\text{K}^+$ Channel Reveals the Basis for Its Specificity	422	Toxins Target Ion Channels	468
Gated Ion Channels Are Central in Neuronal Function	424	<b>12.7 Integrins: Bidirectional Cell Adhesion Receptors</b>	<b>470</b>
Defective Ion Channels Can Have Severe Physiological Consequences	424	<b>12.8 Regulation of Transcription by Nuclear Hormone Receptors</b>	<b>471</b>
<b>12 Biosignaling</b>	<b>433</b>	<b>12.9 Signaling in Microorganisms and Plants</b>	<b>473</b>
<b>12.1 General Features of Signal Transduction</b>	<b>433</b>	Bacterial Signaling Entails Phosphorylation in a Two-Component System	473
<b>BOX 12-1 METHODS: Scatchard Analysis Quantifies the Receptor-Ligand Interaction</b>	<b>435</b>	Signaling Systems of Plants Have Some of the Same Components Used by Microbes and Mammals	473
<b>12.2 G Protein-Coupled Receptors and Second Messengers</b>	<b>437</b>	Plants Detect Ethylene through a Two-Component System and a MAPK Cascade	475
The $\beta$ -Adrenergic Receptor System Acts through the Second Messenger cAMP	438		

Receptorlike Protein Kinases Transduce Signals from Peptides	476	Simple Hydrolysis	522
<b>12.10 Sensory Transduction in Vision, Olfaction, and Gustation</b>	<b>477</b>	ATP Donates Phosphoryl, Pyrophosphoryl, and Adenylyl Groups	523
The Visual System Uses Classic GPCR Mechanisms	477	Assembly of Informational Macromolecules Requires Energy	524
Excited Rhodopsin Acts through the G Protein Transducin to Reduce the cGMP Concentration	478	<b>BOX 13–1 Firefly Flashes: Glowing Reports of ATP</b>	<b>525</b>
The Visual Signal Is Quickly Terminated	480	ATP Energizes Active Transport and Muscle Contraction	525
Cone Cells Specialize in Color Vision	480	Transphosphorylations between Nucleotides Occur in All Cell Types	526
<b>BOX 12–4 MEDICINE: Color Blindness: John Dalton's Experiment from the Grave</b>	<b>481</b>	Inorganic Polyphosphate Is a Potential Phosphoryl Group Donor	527
Vertebrate Olfaction and Gustation Use Mechanisms Similar to the Visual System	481	<b>13.4 Biological Oxidation-Reduction Reactions</b>	<b>528</b>
GPCRs of the Sensory Systems Share Several Features with GPCRs of Hormone Signaling Systems	482	The Flow of Electrons Can Do Biological Work	528
<b>12.11 Regulation of the Cell Cycle by Protein Kinases</b>	<b>484</b>	Oxidation-Reductions Can Be Described as Half-Reactions	528
The Cell Cycle Has Four Stages	484	Biological Oxidations Often Involve Dehydrogenation	529
Levels of Cyclin-Dependent Protein Kinases Oscillate	484	Reduction Potentials Measure Affinity for Electrons	530
CDKs Regulate Cell Division by Phosphorylating Critical Proteins	487	Standard Reduction Potentials Can Be Used to Calculate Free-Energy Change	531
<b>12.12 Oncogenes, Tumor Suppressor Genes, and Programmed Cell Death</b>	<b>488</b>	Cellular Oxidation of Glucose to Carbon Dioxide Requires Specialized Electron Carriers	532
Oncogenes Are Mutant Forms of the Genes for Proteins That Regulate the Cell Cycle	489	A Few Types of Coenzymes and Proteins Serve as Universal Electron Carriers	532
Defects in Certain Genes Remove Normal Restraints on Cell Division	489	NADH and NADPH Act with Dehydrogenases as Soluble Electron Carriers	532
<b>BOX 12–5 MEDICINE: Development of Protein Kinase Inhibitors for Cancer Treatment</b>	<b>490</b>	Dietary Deficiency of Niacin, the Vitamin Form of NAD and NADP, Causes Pellagra	535
Apoptosis Is Programmed Cell Suicide	492	Flavin Nucleotides Are Tightly Bound in Flavoproteins	535
<b>II BIOENERGETICS AND METABOLISM</b>	<b>501</b>	<b>14 Glycolysis, Gluconeogenesis, and the Pentose Phosphate Pathway</b>	<b>543</b>
<b>13 Bioenergetics and Biochemical Reaction Types</b>	<b>505</b>	<b>14.1 Glycolysis</b>	<b>544</b>
<b>13.1 Bioenergetics and Thermodynamics</b>	<b>506</b>	An Overview: Glycolysis Has Two Phases	544
Biological Energy Transformations Obey the Laws of Thermodynamics	506	The Preparatory Phase of Glycolysis Requires ATP	548
Cells Require Sources of Free Energy	507	The Payoff Phase of Glycolysis Yields ATP and NADH	550
Standard Free-Energy Change Is Directly Related to the Equilibrium Constant	507	The Overall Balance Sheet Shows a Net Gain of ATP	555
Actual Free-Energy Changes Depend on Reactant and Product Concentrations	509	Glycolysis Is under Tight Regulation	555
Standard Free-Energy Changes Are Additive	510	<b>BOX 14–1 MEDICINE: High Rate of Glycolysis in Tumors Suggests Targets for Chemotherapy and Facilitates Diagnosis</b>	<b>556</b>
<b>13.2 Chemical Logic and Common Biochemical Reactions</b>	<b>511</b>	Glucose Uptake Is Deficient in Type 1 Diabetes Mellitus	558
Biochemical and Chemical Equations Are Not Identical	517	<b>14.2 Feeder Pathways for Glycolysis</b>	<b>558</b>
<b>13.3 Phosphoryl Group Transfers and ATP</b>	<b>517</b>	Dietary Polysaccharides and Disaccharides Undergo Hydrolysis to Monosaccharides	558
The Free-Energy Change for ATP Hydrolysis Is Large and Negative	518	Endogenous Glycogen and Starch Are Degraded by Phosphorolysis	560
Other Phosphorylated Compounds and Thioesters Also Have Large Free Energies of Hydrolysis	520	Other Monosaccharides Enter the Glycolytic Pathway at Several Points	561
ATP Provides Energy by Group Transfers, Not by		<b>14.3 Fates of Pyruvate under Anaerobic Conditions: Fermentation</b>	<b>563</b>
		Pyruvate Is the Terminal Electron Acceptor in Lactic Acid Fermentation	563
		<b>BOX 14–2 Athletes, Alligators, and Coelacanths:</b>	

<b>BOX 14–2 Athletes, Alligators, and Coelacanths:</b>		
<b>Glycolysis at Limiting Concentrations of Oxygen</b>	<b>564</b>	
Ethanol Is the Reduced Product in Ethanol Fermentation	565	
Thiamine Pyrophosphate Carries “Active Acetaldehyde” Groups	565	
<b>BOX 14–3 Ethanol Fermentations: Brewing Beer and Producing Biofuels</b>	<b>566</b>	
Fermentations Are Used to Produce Some Common Foods and Industrial Chemicals	566	
<b>14.4 Gluconeogenesis</b>	<b>568</b>	
Conversion of Pyruvate to Phosphoenolpyruvate Requires Two Exergonic Reactions	570	
Conversion of Fructose 1,6-Bisphosphate to Fructose 6-Phosphate Is the Second Bypass	572	
Conversion of Glucose 6-Phosphate to Glucose Is the Third Bypass	573	
Gluconeogenesis Is Energetically Expensive, but Essential	573	
Citric Acid Cycle Intermediates and Some Amino Acids Are Glucogenic	574	
Mammals Cannot Convert Fatty Acids to Glucose	574	
Glycolysis and Gluconeogenesis Are Reciprocally Regulated	574	
<b>14.5 Pentose Phosphate Pathway of Glucose Oxidation</b>	<b>575</b>	
The Oxidative Phase Produces Pentose Phosphates and NADPH	575	
<b>BOX 14–4 MEDICINE: Why Pythagoras Wouldn’t Eat Falafel:</b>		
<b>Glucose 6-Phosphate Dehydrogenase Deficiency</b>	<b>576</b>	
The Nonoxidative Phase Recycles Pentose Phosphates to Glucose 6-Phosphate	577	
Wernicke-Korsakoff Syndrome Is Exacerbated by a Defect in Transketolase	580	
Glucose 6-Phosphate Is Partitioned between Glycolysis and the Pentose Phosphate Pathway	580	
<b>15 Principles of Metabolic Regulation</b>	<b>587</b>	
<b>15.1 Regulation of Metabolic Pathways</b>	<b>588</b>	
Cells and Organisms Maintain a Dynamic Steady State	589	
Both the Amount and the Catalytic Activity of an Enzyme Can Be Regulated	589	
Reactions Far from Equilibrium in Cells Are Common Points of Regulation	592	
Adenine Nucleotides Play Special Roles in Metabolic Regulation	594	
<b>15.2 Analysis of Metabolic Control</b>	<b>596</b>	
The Contribution of Each Enzyme to Flux through a Pathway Is Experimentally Measurable	596	
The Flux Control Coefficient Quantifies the Effect of a Change in Enzyme Activity on Metabolite Flux through a Pathway	597	
The Elasticity Coefficient Is Related to an Enzyme’s Responsiveness to Changes in Metabolite or Regulator Concentrations	597	
<b>BOX 15–1 METHODS: Metabolic Control Analysis: Quantitative Aspects</b>	<b>598</b>	
		The Response Coefficient Expresses the Effect of an Outside Controller on Flux through a Pathway 598
		Metabolic Control Analysis Has Been Applied to Carbohydrate Metabolism, with Surprising Results 599
		Metabolic Control Analysis Suggests a General Method for Increasing Flux through a Pathway 600
<b>15.3 Coordinated Regulation of Glycolysis and Gluconeogenesis</b>	<b>601</b>	
Hexokinase Isozymes of Muscle and Liver Are Affected Differently by Their Product, Glucose 6-Phosphate	602	
<b>BOX 15–2 Isozymes: Different Proteins That Catalyze the Same Reaction</b>	<b>602</b>	
Hexokinase IV (Glucokinase) and Glucose 6-Phosphatase Are Transcriptionally Regulated	603	
Phosphofructokinase-1 and Fructose 1,6-Bisphosphatase Are Reciprocally Regulated	604	
Fructose 2,6-Bisphosphate Is a Potent Allosteric Regulator of PFK-1 and FBPase-1	605	
Xylulose 5-Phosphate Is a Key Regulator of Carbohydrate and Fat Metabolism	606	
The Glycolytic Enzyme Pyruvate Kinase Is Allosterically Inhibited by ATP	606	
The Gluconeogenic Conversion of Pyruvate to Phosphoenol Pyruvate Is Under Multiple Types of Regulation	608	
Transcriptional Regulation of Glycolysis and Gluconeogenesis Changes the Number of Enzyme Molecules	608	
<b>BOX 15–3 MEDICINE: Genetic Mutations That Lead to Rare Forms of Diabetes</b>	<b>611</b>	
<b>15.4 The Metabolism of Glycogen in Animals</b>	<b>612</b>	
Glycogen Breakdown Is Catalyzed by Glycogen Phosphorylase	613	
Glucose 1-Phosphate Can Enter Glycolysis or, in Liver, Replenish Blood Glucose	614	
The Sugar Nucleotide UDP-Glucose Donates Glucose for Glycogen Synthesis	615	
<b>BOX 15–4 Carl and Gerty Cori: Pioneers in Glycogen Metabolism and Disease</b>	<b>616</b>	
Glycogenin Primes the Initial Sugar Residues in Glycogen	619	
<b>15.5 Coordinated Regulation of Glycogen Synthesis and Breakdown</b>	<b>620</b>	
Glycogen Phosphorylase Is Regulated Allosterically and Hormonally	621	
Glycogen Synthase Is Also Regulated by Phosphorylation and Dephosphorylation	623	
Glycogen Synthase Kinase 3 Mediates Some of the Actions of Insulin	624	
Phosphoprotein Phosphatase 1 Is Central to Glycogen Metabolism	624	
Allosteric and Hormonal Signals Coordinate Carbohydrate Metabolism Globally	624	
Carbohydrate and Lipid Metabolism Are Integrated by Hormonal and Allosteric Mechanisms	626	

<b>16 The Citric Acid Cycle</b>	<b>633</b>	Acetyl-CoA Can Be Further Oxidized in the Citric Acid Cycle	675
<b>16.1 Production of Acetyl-CoA (Activated Acetate)</b>	<b>633</b>	<b>BOX 17-1 Fat Bears Carry Out <math>\beta</math> Oxidation in Their Sleep</b>	<b>676</b>
Pyruvate Is Oxidized to Acetyl-CoA and CO <sub>2</sub>	634	Oxidation of Unsaturated Fatty Acids Requires Two Additional Reactions	677
The Pyruvate Dehydrogenase Complex Requires Five Coenzymes	634	Complete Oxidation of Odd-Number Fatty Acids Requires Three Extra Reactions	677
The Pyruvate Dehydrogenase Complex Consists of Three Distinct Enzymes	635	Fatty Acid Oxidation Is Tightly Regulated	678
In Substrate Channeling, Intermediates Never Leave the Enzyme Surface	636	Transcription Factors Turn on the Synthesis of Proteins for Lipid Catabolism	679
<b>16.2 Reactions of the Citric Acid Cycle</b>	<b>638</b>	<b>BOX 17-2 Coenzyme B<sub>12</sub>: A Radical Solution to a Perplexing Problem</b>	<b>680</b>
The Sequence of Reactions in the Citric Acid Cycle Makes Chemical Sense	638	Genetic Defects in Fatty Acyl-CoA Dehydrogenases Cause Serious Disease	682
The Citric Acid Cycle Has Eight Steps	640	Peroxisomes Also Carry Out $\beta$ Oxidation	682
<b>BOX 16-1 Moonlighting Enzymes: Proteins with More Than One Job</b>	<b>642</b>	Plant Peroxisomes and Glyoxysomes Use Acetyl-CoA from $\beta$ Oxidation as a Biosynthetic Precursor	683
<b>BOX 16-2 Synthases and Synthetases; Ligases and Lyases; Kinases, Phosphatases, and Phosphorylases: Yes, the Names Are Confusing!</b>	<b>646</b>	The $\beta$ -Oxidation Enzymes of Different Organelles Have Diverged during Evolution	683
The Energy of Oxidations in the Cycle Is Efficiently Conserved	647	The $\omega$ Oxidation of Fatty Acids Occurs in the Endoplasmic Reticulum	684
<b>BOX 16-3 Citrate: A Symmetric Molecule That Reacts Asymmetrically</b>	<b>648</b>	Phytanic Acid Undergoes $\alpha$ Oxidation in Peroxisomes	685
Why Is the Oxidation of Acetate So Complicated?	649	<b>17.3 Ketone Bodies</b>	<b>686</b>
Citric Acid Cycle Components Are Important		Ketone Bodies, Formed in the Liver, Are Exported to Other Organs as Fuel	686
Biosynthetic Intermediates	650	Ketone Bodies Are Overproduced in Diabetes and during Starvation	688
Anaplerotic Reactions Replenish Citric Acid Cycle Intermediates	650		
Biotin in Pyruvate Carboxylase Carries CO <sub>2</sub> Groups	651		
<b>16.3 Regulation of the Citric Acid Cycle</b>	<b>653</b>	<b>18 Amino Acid Oxidation and the Production of Urea</b>	<b>695</b>
Production of Acetyl-CoA by the Pyruvate Dehydrogenase Complex Is Regulated by Allosteric and Covalent Mechanisms	654	<b>18.1 Metabolic Fates of Amino Groups</b>	<b>696</b>
The Citric Acid Cycle Is Regulated at Its Three Exergonic Steps	655	Dietary Protein Is Enzymatically Degraded to Amino Acids	697
Substrate Channeling through Multienzyme Complexes May Occur in the Citric Acid Cycle	655	Pyridoxal Phosphate Participates in the Transfer of $\alpha$ -Amino Groups to $\alpha$ -Ketoglutarate	699
Some Mutations in Enzymes of the Citric Acid Cycle Lead to Cancer	656	Glutamate Releases Its Amino Group As Ammonia in the Liver	700
<b>16.4 The Glyoxylate Cycle</b>	<b>656</b>	Glutamine Transports Ammonia in the Bloodstream	702
The Glyoxylate Cycle Produces Four-Carbon Compounds from Acetate	657	Alanine Transports Ammonia from Skeletal Muscles to the Liver	703
The Citric Acid and Glyoxylate Cycles Are Coordinately Regulated	658	Ammonia Is Toxic to Animals	703
<b>17 Fatty Acid Catabolism</b>	<b>667</b>	<b>18.2 Nitrogen Excretion and the Urea Cycle</b>	<b>704</b>
<b>17.1 Digestion, Mobilization, and Transport of Fats</b>	<b>668</b>	Urea Is Produced from Ammonia in Five Enzymatic Steps	704
Dietary Fats Are Absorbed in the Small Intestine	668	The Citric Acid and Urea Cycles Can Be Linked	706
Hormones Trigger Mobilization of Stored Triacylglycerols	669	The Activity of the Urea Cycle Is Regulated at Two Levels	708
Fatty Acids Are Activated and Transported into Mitochondria	670	Pathway Interconnections Reduce the Energetic Cost of Urea Synthesis	708
<b>17.2 Oxidation of Fatty Acids</b>	<b>672</b>	<b>BOX 18-1 MEDICINE: Assays for Tissue Damage</b>	<b>708</b>
The $\beta$ Oxidation of Saturated Fatty Acids Has Four Basic Steps	673	Genetic Defects in the Urea Cycle Can Be Life-Threatening	709
The Four $\beta$ -Oxidation Steps Are Repeated to Yield Acetyl-CoA and ATP	674	<b>18.3 Pathways of Amino Acid Degradation</b>	<b>710</b>
		Some Amino Acids Are Converted to Glucose, Others to Ketone Bodies	711
		Several Enzyme Cofactors Play Important Roles in Amino Acid Catabolism	712

Six Amino Acids Are Degraded to Pyruvate	715	Hypoxia Leads to ROS Production and Several Adaptive Responses	760
Seven Amino Acids Are Degraded to Acetyl-CoA	717	ATP-Producing Pathways Are Coordinately Regulated	761
Phenylalanine Catabolism Is Genetically Defective in Some People	719		
Five Amino Acids Are Converted to $\alpha$ -Ketoglutarate	721	<b>19.4 Mitochondria in Thermogenesis, Steroid Synthesis, and Apoptosis</b>	<b>762</b>
Four Amino Acids Are Converted to Succinyl-CoA	722	Uncoupled Mitochondria in Brown Adipose Tissue Produce Heat	762
Branched-Chain Amino Acids Are Not Degraded in the Liver	723	Mitochondrial P-450 Oxygenases Catalyze Steroid Hydroxylations	763
<b>BOX 18–2 MEDICINE: Scientific Sleuths Solve a Murder Mystery</b>	<b>724</b>	Mitochondria Are Central to the Initiation of Apoptosis	764
Asparagine and Aspartate Are Degraded to Oxaloacetate	724		
<b>19 Oxidative Phosphorylation and Photophosphorylation</b>	<b>731</b>	<b>19.5 Mitochondrial Genes: Their Origin and the Effects of Mutations</b>	<b>765</b>
<b>OXIDATIVE PHOSPHORYLATION</b>	<b>732</b>	Mitochondria Evolved from Endosymbiotic Bacteria	765
<b>19.1 Electron-Transfer Reactions in Mitochondria</b>	<b>732</b>	Mutations in Mitochondrial DNA Accumulate throughout the Life of the Organism	766
Electrons Are Funneled to Universal Electron Acceptors	734	Some Mutations in Mitochondrial Genomes Cause Disease	767
Electrons Pass through a Series of Membrane-Bound Carriers	735	Diabetes Can Result from Defects in the Mitochondria of Pancreatic $\beta$ Cells	768
Electron Carriers Function in Multienzyme Complexes	737		
Mitochondrial Complexes May Associate in Respirasomes	743	<b>PHOTOSYNTHESIS: HARVESTING LIGHT ENERGY</b>	<b>769</b>
The Energy of Electron Transfer Is Efficiently Conserved in a Proton Gradient	743	<b>19.6 General Features of Photophosphorylation</b>	<b>769</b>
Reactive Oxygen Species Are Generated during Oxidative Phosphorylation	745	Photosynthesis in Plants Takes Place in Chloroplasts	769
<b>BOX 19–1 Hot, Stinking Plants and Alternative Respiratory Pathways</b>	<b>746</b>	Light Drives Electron Flow in Chloroplasts	770
Plant Mitochondria Have Alternative Mechanisms for Oxidizing NADH	746	<b>19.7 Light Absorption</b>	<b>771</b>
<b>19.2 ATP Synthesis</b>	<b>747</b>	Chlorophylls Absorb Light Energy for Photosynthesis	771
ATP Synthase Has Two Functional Domains, $F_0$ and $F_1$	750	Accessory Pigments Extend the Range of Light Absorption	773
ATP Is Stabilized Relative to ADP on the Surface of $F_1$	750	Chlorophyll Funnel the Absorbed Energy to Reaction Centers by Exciton Transfer	774
The Proton Gradient Drives the Release of ATP from the Enzyme Surface	751	<b>19.8 The Central Photochemical Event: Light-Driven Electron Flow</b>	<b>776</b>
Each $\beta$ Subunit of ATP Synthase Can Assume Three Different Conformations	752	Bacteria Have One of Two Types of Single Photochemical Reaction Center	776
Rotational Catalysis Is Key to the Binding-Change Mechanism for ATP Synthesis	752	Kinetic and Thermodynamic Factors Prevent the Dissipation of Energy by Internal Conversion	778
How Does Proton Flow through the $F_0$ Complex Produce Rotary Motion?	755	In Plants, Two Reaction Centers Act in Tandem	779
Chemiosmotic Coupling Allows Nonintegral Stoichiometries of $O_2$ Consumption and ATP Synthesis	755	Antenna Chlorophylls Are Tightly Integrated with Electron Carriers	781
<b>BOX 19–2 METHODS: Atomic Force Microscopy to Visualize Membrane Proteins</b>	<b>756</b>	The Cytochrome $b_6f$ Complex Links Photosystems II and I	782
The Proton-Motive Force Energizes Active Transport	757	Cyclic Electron Flow between PSI and the Cytochrome $b_6f$ Complex Increases the Production of ATP Relative to NADPH	783
Shuttle Systems Indirectly Convey Cytosolic NADH into Mitochondria for Oxidation	758	State Transitions Change the Distribution of LHCII between the Two Photosystems	783
<b>19.3 Regulation of Oxidative Phosphorylation</b>	<b>759</b>	Water Is Split by the Oxygen-Evolving Complex	784
Oxidative Phosphorylation Is Regulated by Cellular Energy Needs	760	<b>19.9 ATP Synthesis by Photophosphorylation</b>	<b>786</b>
An Inhibitory Protein Prevents ATP Hydrolysis during Hypoxia	760	A Proton Gradient Couples Electron Flow and Phosphorylation	786
		The Approximate Stoichiometry of Photophosphorylation Has Been Established	787
		The ATP Synthase of Chloroplasts Is Like That of Mitochondria	787

<b>19.10 The Evolution of Oxygenic Photosynthesis</b>	<b>788</b>	Fatty Acid Synthase Receives the Acetyl and Malonyl Groups	836
Chloroplasts Evolved from Ancient Photosynthetic Bacteria	788	The Fatty Acid Synthase Reactions Are Repeated to Form Palmitate	838
In <i>Halobacterium</i> , a Single Protein Absorbs Light and Pumps Protons to Drive ATP Synthesis	789	Fatty Acid Synthesis Occurs in the Cytosol of Many Organisms but in the Chloroplasts of Plants	839
<b>20 Carbohydrate Biosynthesis in Plants and Bacteria</b>	<b>799</b>	Acetate Is Shuttled out of Mitochondria as Citrate	840
<b>20.1 Photosynthetic Carbohydrate Synthesis</b>	<b>799</b>	Fatty Acid Biosynthesis Is Tightly Regulated	840
Plastids Are Organelles Unique to Plant Cells and Algae	800	Long-Chain Saturated Fatty Acids Are Synthesized from Palmitate	842
Carbon Dioxide Assimilation Occurs in Three Stages	801	Desaturation of Fatty Acids Requires a Mixed-Function Oxidase	842
Synthesis of Each Triose Phosphate from CO <sub>2</sub> Requires Six NADPH and Nine ATP	808	<b>BOX 21-1 MEDICINE: Mixed-Function Oxidases, Cytochrome P-450 Enzymes, and Drug Overdoses</b>	<b>844</b>
A Transport System Exports Triose Phosphates from the Chloroplast and Imports Phosphate	809	Eicosanoids Are Formed from 20-Carbon Polyunsaturated Fatty Acids	845
Four Enzymes of the Calvin Cycle Are Indirectly Activated by Light	810	<b>21.2 Biosynthesis of Triacylglycerols</b>	<b>848</b>
<b>20.2 Photorespiration and the C<sub>4</sub> and CAM Pathways</b>	<b>812</b>	Triacylglycerols and Glycerophospholipids Are Synthesized from the Same Precursors	848
Photorespiration Results from Rubisco's Oxygenase Activity	812	Triacylglycerol Biosynthesis in Animals Is Regulated by Hormones	849
The Salvage of Phosphoglycolate Is Costly	813	Adipose Tissue Generates Glycerol 3-phosphate by Glyceroneogenesis	850
In C <sub>4</sub> Plants, CO <sub>2</sub> Fixation and Rubisco Activity Are Spatially Separated	815	Thiazolidinediones Treat Type 2 Diabetes by Increasing Glyceroneogenesis	852
<b>BOX 20-1 Will Genetic Engineering of Photosynthetic Organisms Increase Their Efficiency?</b>	<b>816</b>	<b>21.3 Biosynthesis of Membrane Phospholipids</b>	<b>852</b>
In CAM Plants, CO <sub>2</sub> Capture and Rubisco Action Are Temporally Separated	818	Cells Have Two Strategies for Attaching Phospholipid Head Groups	852
<b>20.3 Biosynthesis of Starch and Sucrose</b>	<b>818</b>	Phospholipid Synthesis in <i>E. coli</i> Employs CDP-Diacylglycerol	853
ADP-Glucose Is the Substrate for Starch Synthesis in Plant Plastids and for Glycogen Synthesis in Bacteria	818	Eukaryotes Synthesize Anionic Phospholipids from CDP-Diacylglycerol	855
UDP-Glucose Is the Substrate for Sucrose Synthesis in the Cytosol of Leaf Cells	819	Eukaryotic Pathways to Phosphatidylserine, Phosphatidylethanolamine, and Phosphatidylcholine Are Interrelated	855
Conversion of Triose Phosphates to Sucrose and Starch Is Tightly Regulated	820	Plasmalogen Synthesis Requires Formation of an Ether-Linked Fatty Alcohol	856
<b>20.4 Synthesis of Cell Wall Polysaccharides: Plant Cellulose and Bacterial Peptidoglycan</b>	<b>821</b>	Sphingolipid and Glycerophospholipid Synthesis Share Precursors and Some Mechanisms	857
Cellulose Is Synthesized by Supramolecular Structures in the Plasma Membrane	822	Polar Lipids Are Targeted to Specific Cellular Membranes	857
Lipid-Linked Oligosaccharides Are Precursors for Bacterial Cell Wall Synthesis	823	<b>21.4 Cholesterol, Steroids, and Isoprenoids: Biosynthesis, Regulation, and Transport</b>	<b>859</b>
<b>20.5 Integration of Carbohydrate Metabolism in the Plant Cell</b>	<b>825</b>	Cholesterol Is Made from Acetyl-CoA in Four Stages	860
Gluconeogenesis Converts Fats and Proteins to Glucose in Germinating Seeds	825	Cholesterol Has Several Fates	864
Pools of Common Intermediates Link Pathways in Different Organelles	826	Cholesterol and Other Lipids Are Carried on Plasma Lipoproteins	864
<b>21 Lipid Biosynthesis</b>	<b>833</b>	<b>BOX 21-2 MEDICINE: ApoE Alleles Predict Incidence of Alzheimer Disease</b>	<b>866</b>
<b>21.1 Biosynthesis of Fatty Acids and Eicosanoids</b>	<b>833</b>	Cholesteryl Esters Enter Cells by Receptor-Mediated Endocytosis	868
Malonyl-CoA Is Formed from Acetyl-CoA and Bicarbonate	833	HDL Carries Out Reverse Cholesterol Transport	869
Fatty Acid Synthesis Proceeds in a Repeating Reaction Sequence	834	Cholesterol Synthesis and Transport Is Regulated at Several Levels	869
The Mammalian Fatty Acid Synthase Has Multiple Active Sites	834	Dysregulation of Cholesterol Metabolism Can Lead to Cardiovascular Disease	871
		<b>BOX 21-3 MEDICINE: The Lipid Hypothesis and the Development of Statins</b>	<b>872</b>
		Reverse Cholesterol Transport by HDL Counters Plaque Formation and Atherosclerosis	873

Steroid Hormones Are Formed by Side-Chain Cleavage and Oxidation of Cholesterol	874	Degradation of Purines and Pyrimidines Produces Uric Acid and Urea, Respectively	920
Intermediates in Cholesterol Biosynthesis Have Many Alternative Fates	874	Purine and Pyrimidine Bases Are Recycled by Salvage Pathways	922
<b>22 Biosynthesis of Amino Acids, Nucleotides, and Related Molecules</b>	<b>881</b>	Excess Uric Acid Causes Gout	922
<b>22.1 Overview of Nitrogen Metabolism</b>	<b>881</b>	Many Chemotherapeutic Agents Target Enzymes in the Nucleotide Biosynthetic Pathways	923
The Nitrogen Cycle Maintains a Pool of Biologically Available Nitrogen	882	<b>23 Hormonal Regulation and Integration of Mammalian Metabolism</b>	<b>929</b>
Nitrogen Is Fixed by Enzymes of the Nitrogenase Complex	882	<b>23.1 Hormones: Diverse Structures for Diverse Functions</b>	<b>929</b>
<b>BOX 22-1 Unusual Lifestyles of the Obscure but Abundant</b>	<b>884</b>	The Detection and Purification of Hormones Requires a Bioassay	930
Ammonia Is Incorporated into Biomolecules through Glutamate and Glutamine	888	<b>BOX 23-1 MEDICINE: How Is a Hormone Discovered? The Arduous Path to Purified Insulin</b>	<b>931</b>
Glutamine Synthetase Is a Primary Regulatory Point in Nitrogen Metabolism	889	Hormones Act through Specific High-Affinity Cellular Receptors	932
Several Classes of Reactions Play Special Roles in the Biosynthesis of Amino Acids and Nucleotides	890	Hormones Are Chemically Diverse	933
<b>22.2 Biosynthesis of Amino Acids</b>	<b>891</b>	Hormone Release Is Regulated by a Hierarchy of Neuronal and Hormonal Signals	936
$\alpha$ -Ketoglutarate Gives Rise to Glutamate, Glutamine, Proline, and Arginine	892	<b>23.2 Tissue-Specific Metabolism: The Division of Labor</b>	<b>939</b>
Serine, Glycine, and Cysteine Are Derived from 3-Phosphoglycerate	892	The Liver Processes and Distributes Nutrients	939
Three Nonessential and Six Essential Amino Acids Are Synthesized from Oxaloacetate and Pyruvate	895	Adipose Tissues Store and Supply Fatty Acids	943
Chorismate Is a Key Intermediate in the Synthesis of Tryptophan, Phenylalanine, and Tyrosine	898	Brown Adipose Tissue Is Thermogenic	944
Histidine Biosynthesis Uses Precursors of Purine Biosynthesis	898	Muscles Use ATP for Mechanical Work	944
Amino Acid Biosynthesis Is under Allosteric Regulation	899	<b>BOX 23-2 Creatine and Creatine Kinase: Invaluable Diagnostic Aids and the Muscle Builder's Friends</b>	<b>946</b>
<b>22.3 Molecules Derived from Amino Acids</b>	<b>902</b>	The Brain Uses Energy for Transmission of Electrical Impulses	948
Glycine Is a Precursor of Porphyrins	902	Blood Carries Oxygen, Metabolites, and Hormones	949
Heme Is the Source of Bile Pigments	904	<b>23.3 Hormonal Regulation of Fuel Metabolism</b>	<b>951</b>
<b>BOX 22-2 MEDICINE: On Kings and Vampires</b>	<b>906</b>	Insulin Counters High Blood Glucose	951
Amino Acids Are Precursors of Creatine and Glutathione	906	Pancreatic $\beta$ Cells Secrete Insulin in Response to Changes in Blood Glucose	953
D-Amino Acids Are Found Primarily in Bacteria	907	Glucagon Counters Low Blood Glucose	955
Aromatic Amino Acids Are Precursors of Many Plant Substances	908	During Fasting and Starvation, Metabolism Shifts to Provide Fuel for the Brain	956
Biological Amines Are Products of Amino Acid Decarboxylation	908	Epinephrine Signals Impending Activity	958
Arginine Is the Precursor for Biological Synthesis of Nitric Oxide	909	Cortisol Signals Stress, Including Low Blood Glucose	958
<b>22.4 Biosynthesis and Degradation of Nucleotides</b>	<b>910</b>	Diabetes Mellitus Arises from Defects in Insulin Production or Action	959
De Novo Purine Nucleotide Synthesis Begins with PRPP	912	<b>23.4 Obesity and the Regulation of Body Mass</b>	<b>960</b>
Purine Nucleotide Biosynthesis Is Regulated by Feedback Inhibition	914	Adipose Tissue Has Important Endocrine Functions	960
Pyrimidine Nucleotides Are Made from Aspartate, PRPP, and Carbamoyl Phosphate	915	Leptin Stimulates Production of Anorexigenic Peptide Hormones	962
Pyrimidine Nucleotide Biosynthesis Is Regulated by Feedback Inhibition	916	Leptin Triggers a Signaling Cascade That Regulates Gene Expression	962
Nucleoside Monophosphates Are Converted to Nucleoside Triphosphates	916	The Leptin System May Have Evolved to Regulate the Starvation Response	963
Ribonucleotides Are the Precursors of Deoxyribonucleotides	917	Insulin Acts in the Arcuate Nucleus to Regulate Eating and Energy Conservation	963
Thymidylate Is Derived from dCDP and dUMP	920	Adiponectin Acts through AMPK to Increase Insulin Sensitivity	964
		mTORC1 Activity Coordinates Cell Growth with the Supply of Nutrients and Energy	965
		Diet Regulates the Expression of Genes Central to Maintaining Body Mass	965
		Short-Term Eating Behavior Is Influenced by Ghrelin and PYY <sub>3-36</sub>	966

Microbial Symbionts in the Gut Influence Energy Metabolism and Adipogenesis	968		
<b>23.5 Obesity, the Metabolic Syndrome, and Type 2 Diabetes</b>	<b>968</b>	<b>25.2 DNA Repair</b>	<b>1027</b>
In Type 2 Diabetes the Tissues Become Insensitive to Insulin	968	Mutations Are Linked to Cancer	1027
Type 2 Diabetes Is Managed with Diet, Exercise, and Medication	970	All Cells Have Multiple DNA Repair Systems	1028
		The Interaction of Replication Forks with DNA Damage Can Lead to Error-Prone Translesion DNA Synthesis	1034
		<b>BOX 25–1 MEDICINE: DNA Repair and Cancer</b>	<b>1037</b>
		<b>25.3 DNA Recombination</b>	<b>1038</b>
		Bacterial Homologous Recombination Is a DNA Repair Function	1039
		Eukaryotic Homologous Recombination Is Required for Proper Chromosome Segregation during Meiosis	1041
		Recombination during Meiosis Is Initiated with Double-Strand Breaks	1043
		<b>BOX 25–2 MEDICINE: Why Proper Chromosomal Segregation Matters</b>	<b>1045</b>
		Site-Specific Recombination Results in Precise DNA Rearrangements	1046
		Transposable Genetic Elements Move from One Location to Another	1049
		Immunoglobulin Genes Assemble by Recombination	1049
<b>III INFORMATION PATHWAYS</b>	<b>977</b>	<b>26 RNA Metabolism</b>	<b>1057</b>
<b>24 Genes and Chromosomes</b>	<b>979</b>	<b>26.1 DNA-Dependent Synthesis of RNA</b>	<b>1058</b>
<b>24.1 Chromosomal Elements</b>	<b>979</b>	RNA Is Synthesized by RNA Polymerases	1058
Genes Are Segments of DNA That Code for Polypeptide Chains and RNAs	979	RNA Synthesis Begins at Promoters	1060
DNA Molecules Are Much Longer Than the Cellular or Viral Packages That Contain Them	980	Transcription Is Regulated at Several Levels	1061
Eukaryotic Genes and Chromosomes Are Very Complex	984	<b>BOX 26–1 METHODS: RNA Polymerase Leaves Its Footprint on a Promoter</b>	<b>1062</b>
<b>24.2 DNA Supercoiling</b>	<b>985</b>	Specific Sequences Signal Termination of RNA Synthesis	1063
Most Cellular DNA Is Underwound	986	Eukaryotic Cells Have Three Kinds of Nuclear RNA Polymerases	1064
DNA Underwinding Is Defined by Topological Linking Number	988	RNA Polymerase II Requires Many Other Protein Factors for Its Activity	1064
Topoisomerases Catalyze Changes in the Linking Number of DNA	989	DNA-Dependent RNA Polymerase Undergoes Selective Inhibition	1068
DNA Compaction Requires a Special Form of Supercoiling	990	<b>26.2 RNA Processing</b>	<b>1069</b>
<b>BOX 24–1 MEDICINE: Curing Disease by Inhibiting Topoisomerases</b>	<b>992</b>	Eukaryotic mRNAs Are Capped at the 5' End	1070
<b>24.3 The Structure of Chromosomes</b>	<b>994</b>	Both Introns and Exons Are Transcribed from DNA into RNA	1070
Chromatin Consists of DNA and Proteins	994	RNA Catalyzes the Splicing of Introns	1070
Histones Are Small, Basic Proteins	995	Eukaryotic mRNAs Have a Distinctive 3' End Structure	1075
Nucleosomes Are the Fundamental Organizational Units of Chromatin	995	A Gene Can Give Rise to Multiple Products by Differential RNA Processing	1075
Nucleosomes Are Packed into Successively Higher-Order Structures	997	Ribosomal RNAs and tRNAs Also Undergo Processing	1077
<b>BOX 24–2 MEDICINE: Epigenetics, Nucleosome Structure, and Histone Variants</b>	<b>998</b>	Special-Function RNAs Undergo Several Types of Processing	1081
Condensed Chromosome Structures Are Maintained by SMC Proteins	1000	RNA Enzymes Are the Catalysts of Some Events in RNA Metabolism	1082
Bacterial DNA Is Also Highly Organized	1002	Cellular mRNAs Are Degraded at Different Rates	1084
<b>25 DNA Metabolism</b>	<b>1009</b>	Polynucleotide Phosphorylase Makes Random RNA-Like Polymers	1085
<b>25.1 DNA Replication</b>	<b>1011</b>	<b>26.3 RNA-Dependent Synthesis of RNA and DNA</b>	<b>1085</b>
DNA Replication Follows a Set of Fundamental Rules	1011	Reverse Transcriptase Produces DNA from Viral RNA	1086
DNA Is Degraded by Nucleases	1013	Some Retroviruses Cause Cancer and AIDS	1088
DNA Is Synthesized by DNA Polymerases	1013		
Replication Is Very Accurate	1015		
<i>E. coli</i> Has at Least Five DNA Polymerases	1016		
DNA Replication Requires Many Enzymes and Protein Factors	1017		
Replication of the <i>E. coli</i> Chromosome Proceeds in Stages	1019		
Replication in Eukaryotic Cells Is Similar but More Complex	1025		
Viral DNA Polymerases Provide Targets for Antiviral Therapy	1026		

Many Transposons, Retroviruses, and Introns May Have a Common Evolutionary Origin	1088	Protein Degradation Is Mediated by Specialized Systems in All Cells	1147
<b>BOX 26-2 MEDICINE: Fighting AIDS with Inhibitors of HIV Reverse Transcriptase</b>	<b>1089</b>	<b>28 Regulation of Gene Expression</b>	<b>1155</b>
Telomerase Is a Specialized Reverse Transcriptase	1089	<b>28.1 Principles of Gene Regulation</b>	<b>1156</b>
Some Viral RNAs Are Replicated by RNA-Dependent RNA Polymerase	1092	RNA Polymerase Binds to DNA at Promoters	1156
RNA Synthesis Offers Important Clues to Biochemical Evolution	1092	Transcription Initiation Is Regulated by Proteins That Bind to or near Promoters	1157
<b>BOX 26-3 METHODS: The SELEX Method for Generating RNA Polymers with New Functions</b>	<b>1095</b>	Many Bacterial Genes Are Clustered and Regulated in Operons	1158
<b>BOX 26-4 An Expanding RNA Universe Filled with TUF RNAs</b>	<b>1096</b>	The <i>lac</i> Operon Is Subject to Negative Regulation	1159
<b>27 Protein Metabolism</b>	<b>1103</b>	Regulatory Proteins Have Discrete DNA-Binding Domains	1160
<b>27.1 The Genetic Code</b>	<b>1103</b>	Regulatory Proteins Also Have Protein-Protein Interaction Domains	1163
The Genetic Code Was Cracked Using Artificial mRNA Templates	1104	<b>28.2 Regulation of Gene Expression in Bacteria</b>	<b>1165</b>
<b>BOX 27-1 Exceptions That Prove the Rule: Natural Variations in the Genetic Code</b>	<b>1108</b>	The <i>lac</i> Operon Undergoes Positive Regulation	1165
Wobble Allows Some tRNAs to Recognize More than One Codon	1108	Many Genes for Amino Acid Biosynthetic Enzymes Are Regulated by Transcription Attenuation	1167
The Genetic Code Is Mutation-Resistant	1110	Induction of the SOS Response Requires Destruction of Repressor Proteins	1169
Translational Frameshifting and RNA Editing Affect How the Code Is Read	1111	Synthesis of Ribosomal Proteins Is Coordinated with rRNA Synthesis	1170
<b>27.2 Protein Synthesis</b>	<b>1113</b>	The Function of Some mRNAs Is Regulated by Small RNAs in Cis or in Trans	1171
Protein Biosynthesis Takes Place in Five Stages	1114	Some Genes Are Regulated by Genetic Recombination	1173
The Ribosome Is a Complex Supramolecular Machine	1115	<b>28.3 Regulation of Gene Expression in Eukaryotes</b>	<b>1175</b>
<b>BOX 27-2 From an RNA World to a Protein World</b>	<b>1117</b>	Transcriptionally Active Chromatin Is Structurally Distinct from Inactive Chromatin	1175
Transfer RNAs Have Characteristic Structural Features	1118	Most Eukaryotic Promoters Are Positively Regulated	1176
Stage 1: Aminoacyl-tRNA Synthetases Attach the Correct Amino Acids to Their tRNAs	1119	DNA-Binding Activators and Coactivators Facilitate Assembly of the General Transcription Factors	1177
Proofreading by Aminoacyl-tRNA Synthetases	1121	The Genes of Galactose Metabolism in Yeast Are Subject to Both Positive and Negative Regulation	1180
Interaction between an Aminoacyl-tRNA Synthetase and a tRNA: A "Second Genetic Code"	1122	Transcription Activators Have a Modular Structure	1181
<b>BOX 27-3 Natural and Unnatural Expansion of the Genetic Code</b>	<b>1124</b>	Eukaryotic Gene Expression Can Be Regulated by Intercellular and Intracellular Signals	1182
Stage 2: A Specific Amino Acid Initiates Protein Synthesis	1127	Regulation Can Result from Phosphorylation of Nuclear Transcription Factors	1184
Stage 3: Peptide Bonds Are Formed in the Elongation Stage	1129	Many Eukaryotic mRNAs Are Subject to Translational Repression	1184
Stage 4: Termination of Polypeptide Synthesis Requires a Special Signal	1134	Posttranscriptional Gene Silencing Is Mediated by RNA Interference	1185
<b>BOX 27-4 Induced Variation in the Genetic Code: Nonsense Suppression</b>	<b>1134</b>	RNA-Mediated Regulation of Gene Expression Takes Many Forms in Eukaryotes	1186
Stage 5: Newly Synthesized Polypeptide Chains Undergo Folding and Processing	1136	Development Is Controlled by Cascades of Regulatory Proteins	1186
Protein Synthesis Is Inhibited by Many Antibiotics and Toxins	1138	Stem Cells Have Developmental Potential That Can Be Controlled	1191
<b>27.3 Protein Targeting and Degradation</b>	<b>1139</b>	<b>BOX 28-1 Of Fins, Wings, Beaks, and Things</b>	<b>1194</b>
Posttranslational Modification of Many Eukaryotic Proteins Begins in the Endoplasmic Reticulum	1140	<b>Abbreviated Solutions to Problems</b>	<b>AS-1</b>
Glycosylation Plays a Key Role in Protein Targeting	1141	<b>Glossary</b>	<b>G-1</b>
Signal Sequences for Nuclear Transport Are Not Cleaved	1143	<b>Credits</b>	<b>C-0</b>
Bacteria Also Use Signal Sequences for Protein Targeting	1145	<b>Index</b>	<b>I-1</b>
Cells Import Proteins by Receptor-Mediated Endocytosis	1146
